1.0 PREFACE

1.1 Scope

1.2 Introduction

**1.3 A Brief Description and Comparison of the 707
Family of Airplanes**

1.0 SCOPE AND INTRODUCTION

1.1 Scope

This document provides in a standardized format the recommended minimum airplane characteristics data that are needed for general airport planning information. Since operational practices vary among airlines, specific data should be coordinated with the using airlines prior to facility design. The Boeing Company should be contacted for any additional information required.

Format of the document reflects the results of a coordinated effort by representatives from the following organizations:

Aerospace Industries Association of America
Airport Operators' Council International
Air Transport Association of America
International Air Transport Association

1.2 Introduction

This document conforms to NAS 3601. It provides characteristics of the Boeing Model 707 family of airplanes for airport operators, airlines, and engineering consultant organizations. Airplane changes and available options may alter model characteristics; the data presented herein reflect typical airplanes in each model category.

For additional information contact:

The Boeing Company
Commercial Airplane Division
P. O. Box 707
Renton, Washington 98055
U. S. A.

**Attention: Chief, Airport Studies
Air Commerce Research**

1.3 A Brief Description and Comparison of the 707 Family of Airplanes

Model Development

The 707 family of airplanes was derived from the original 707 prototype (Boeing Model 367-80). The original 707-100 Series was developed from the 367-80, and all the other 707 models were derived from the 707-100. Throughout the development of subsequent models, the constant body section (height and width) of the 707-100 was maintained.

Model designations of the 707 family fall into four categories: 707-100 series, 707-200 series, 707-300 series, and 707-400 series. The -100 and -200 series are used on domestic routes. The majority of the -300 and -400 series are used in intercontinental service.

The 707-200 series was developed to meet a specific requirement for an airplane that would be lighter and carry somewhat less payload than the -100. It is essentially the same as the -100 except that it has a different engine and a smaller gross weight.

The 707-300 series was developed to meet the performance requirements for intercontinental service. These airplanes have a longer body, greater wingspan (with high-lift trailing-edge flaps and improved leading-edge flaps), and higher gross weight.

Model Comparison

Model 707-100 and 707-200 series airplanes are represented in this document by the 707-120B. The 707-120 and -220 airplanes originally had non-fan engines (JT3C and JT4A respectively); the majority of the -120's have been modified with JT3D fan engines to yield the 707-120B.

Model 707-300 series airplanes are represented in this document by the 707-320, -320B and -320C. The -320 airplanes have JT4A non-fan engines; the -320B and -320C airplanes have JT3D fan engines.

Model 707-400 series airplanes are represented by the 707-420. The 707-420 is the same as the 707-320 except that it has Rolls-Royce engines rather than Pratt and Whitney engines.

The 707-120, -220, -320, -320B, and -420 are passenger airplanes. The -320C is manufactured in a convertible passenger/cargo version and a strictly freighter version.

The data on the following two pages provide an overall comparison of the members of the 707 family. Minor dimensional and/or performance differences may exist between some models of the same series as a result of customer option; however, the data presented represent typical airplanes in each model category.

MODEL	ENGINE TYPE	LENGTH		SPAN		BODY		VERTICAL TAIL HEIGHT*	MAXIMUM RAMP WEIGHT (LB)

2.0 AIRPLANE DESCRIPTION

2.1 General Characteristics — Model 707

(Definition of terms used on page 9)

Maximum Ramp Weight. Maximum weight authorized for ground maneuver by the applicable government regulations, including taxi and runup fuel. Also designated in some manuals as maximum design taxi weight.

Maximum Landing Weight. Maximum weight authorized at touchdown by the applicable government regulations.

Maximum Takeoff Weight. Maximum weight authorized at takeoff brake release by the applicable government regulations and excludes taxi and runup fuel.

Operating Empty Weight. Weight of structure, power plant, furnishings, systems, unusable fuel and other unusable propulsion agents, and other items of equipment that are considered an integral part of a particular aircraft configuration. Also included are certain standard items, personnel, equipment, and supplies necessary for full operation, excluding fuel and payload.

Zero Fuel Weight. Maximum airplane weight less usable fuel, engine injection fluid, and other consumable propulsion agents. It may include usable fuel in specified tanks when carried in lieu of payload. The addition of usable and consumable items to the Zero Fuel Weight must be in accordance with the applicable government regulations so that airplane structure and airworthiness requirements are not exceeded.

Maximum Structural Payload. Consists of the maximum design payload weight of passengers, passenger baggage and/or cargo.

Maximum Seating Capacity. The maximum number of passengers specifically certified or anticipated for certification.

Maximum Cargo Volume. The maximum space available for cargo.

Usable Fuel Capacity. The volume of fuel carried for a particular operation less drainable unusable fuel and trapped fuel remaining after a fuel runout test has been accomplished.

• AIRPLANE IS IN LEVEL ATTITUDE WITH NO WING DEFLECTION.

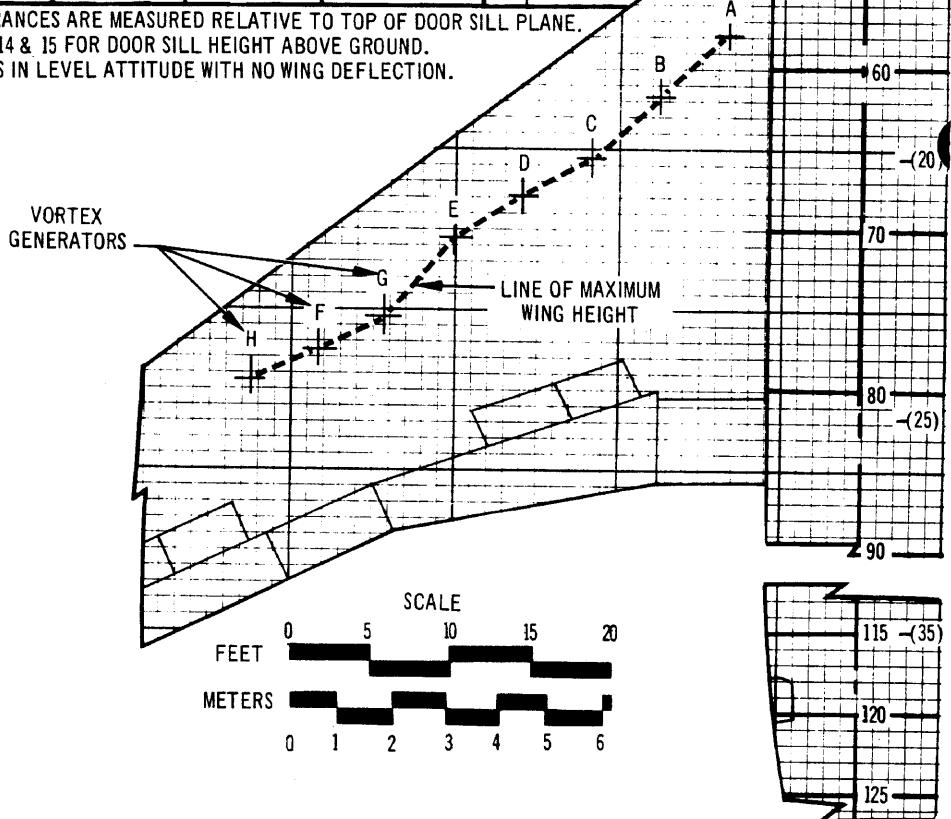

DOOR SILL/WING CLEARANCE — CRITICAL INTERFERENCE PATH
MODEL 707-320, -320B, -320C, -420

3.0 AIRPLANE PERFORMANCE

- 3.1 Payload/Range for Long Range Cruise**
- 3.2 C.A.R. Takeoff Runway Length Requirements**
- 3.3 C.A.R. Landing Runway Length Requirements**

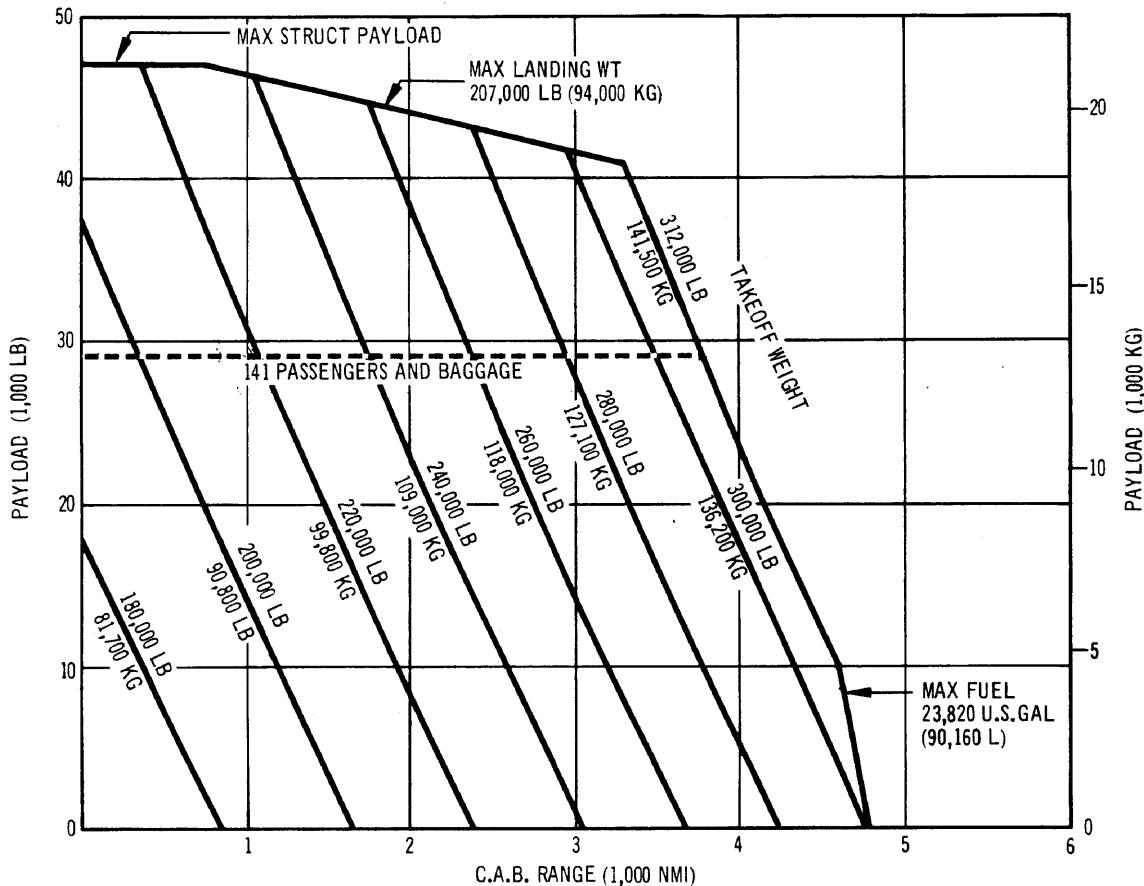

- NOTES:
- OEW = 127,500 LB (57,600 KG), AN AVERAGE AIRLINE VALUE;
IF SPECIFIC FIGURES ARE REQUIRED, CONSULT USING AIRLINE.
 - JT3D-3 ENGINES
 - STANDARD DAY-ZERO WIND
 - ATA DOMESTIC FUEL RESERVES—200 NAUTICAL MILE ALTERNATE

3.1 PAYLOAD/RANGE FOR LONG RANGE STEP CLIMB CRUISE MODEL 707-120B PASSENGER - DOMESTIC

NOTES: ● OEW = 142,600 LB (64,600 KG), AN AVERAGE AIRLINE VALUE;
IF SPECIFIC FIGURES ARE REQUIRED, CONSULT USING AIRLINE.

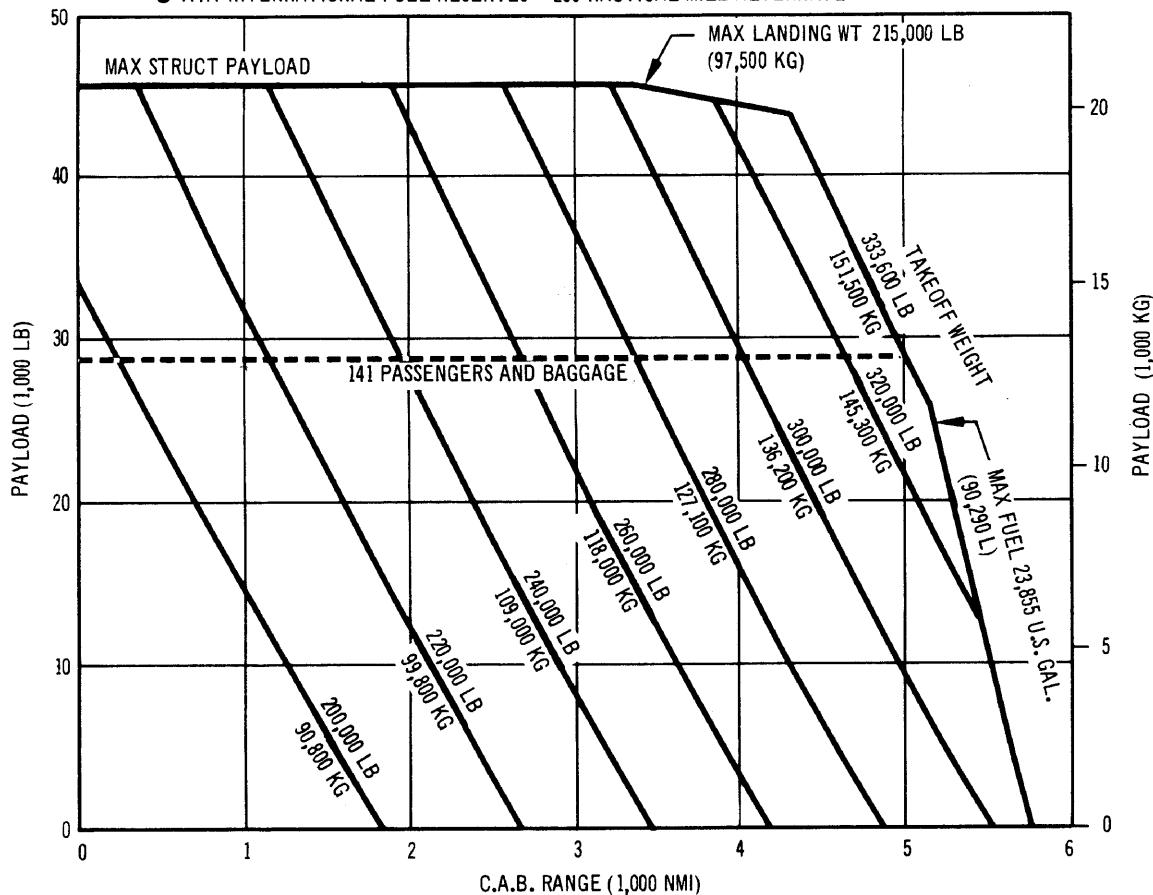

- JT4A-11 ENGINES
- STANDARD DAY—ZERO WIND
- ATA INTERNATIONAL FUEL RESERVES – 200 NAUTICAL MILE ALTERNATE

PAYOUT/RANGE FOR LONG RANGE STEP CLIMB CRUISE
MODEL 707-320 PASSENGER - INTERNATIONAL

NOTES: ● OEW = 148,800 LB (67,500 KG), AN AVERAGE AIRLINE VALUE;
IF SPECIFIC FIGURES ARE REQUIRED, CONSULT USING AIRLINE.

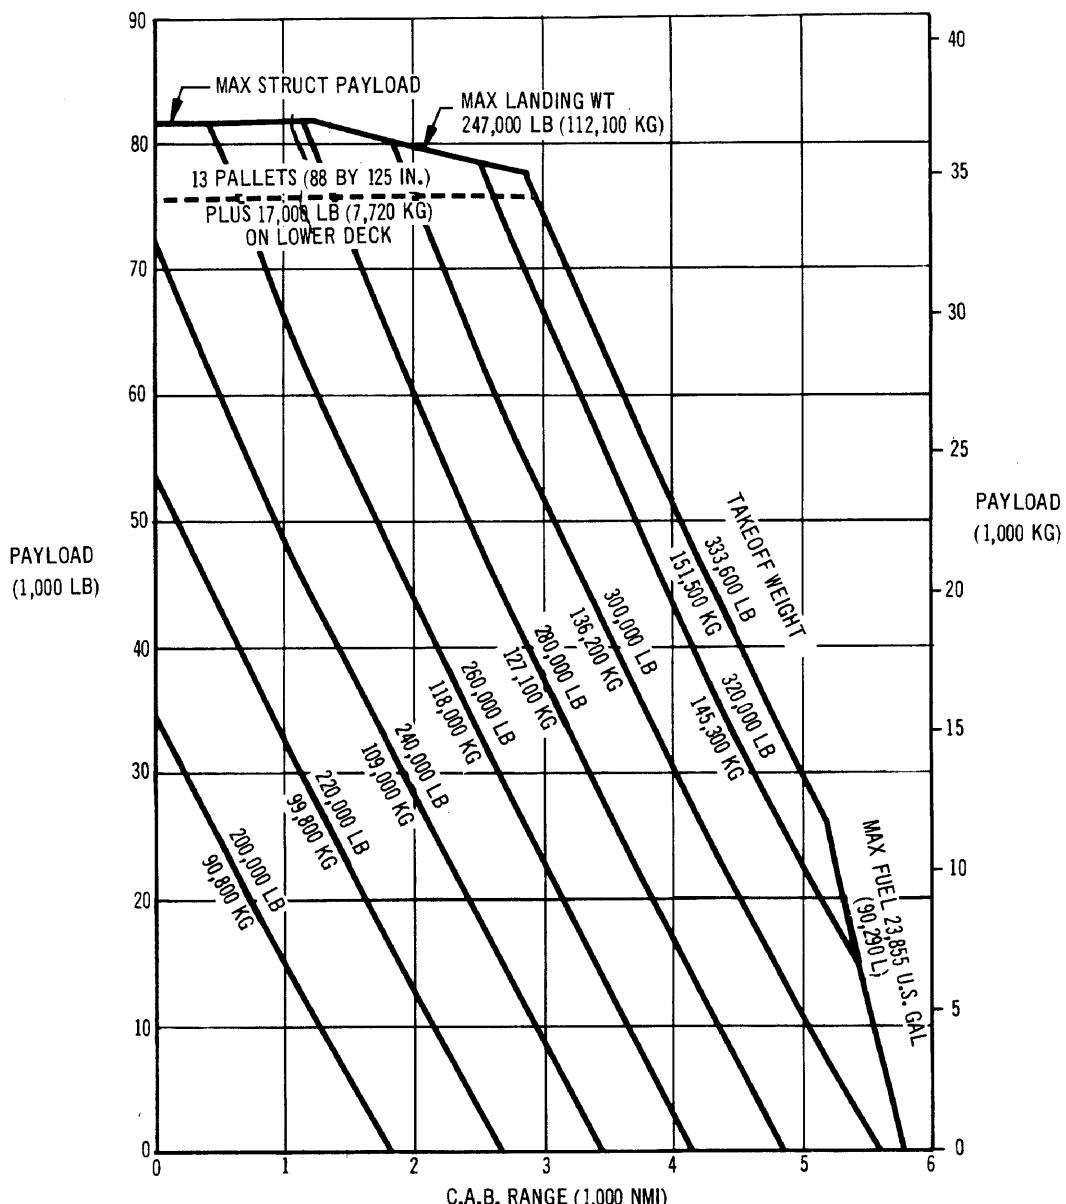

- JT3D-3B (1C) ENGINES
- STANDARD DAY—ZERO WIND
- ATA INTERNATIONAL FUEL RESERVES — 200 NAUTICAL MILE ALTERNATE

PAYOUT/RANGE FOR LONG RANGE STEP CLIMB CRUISE
MODEL 707-320B ADV PASSENGER - INTERNATIONAL

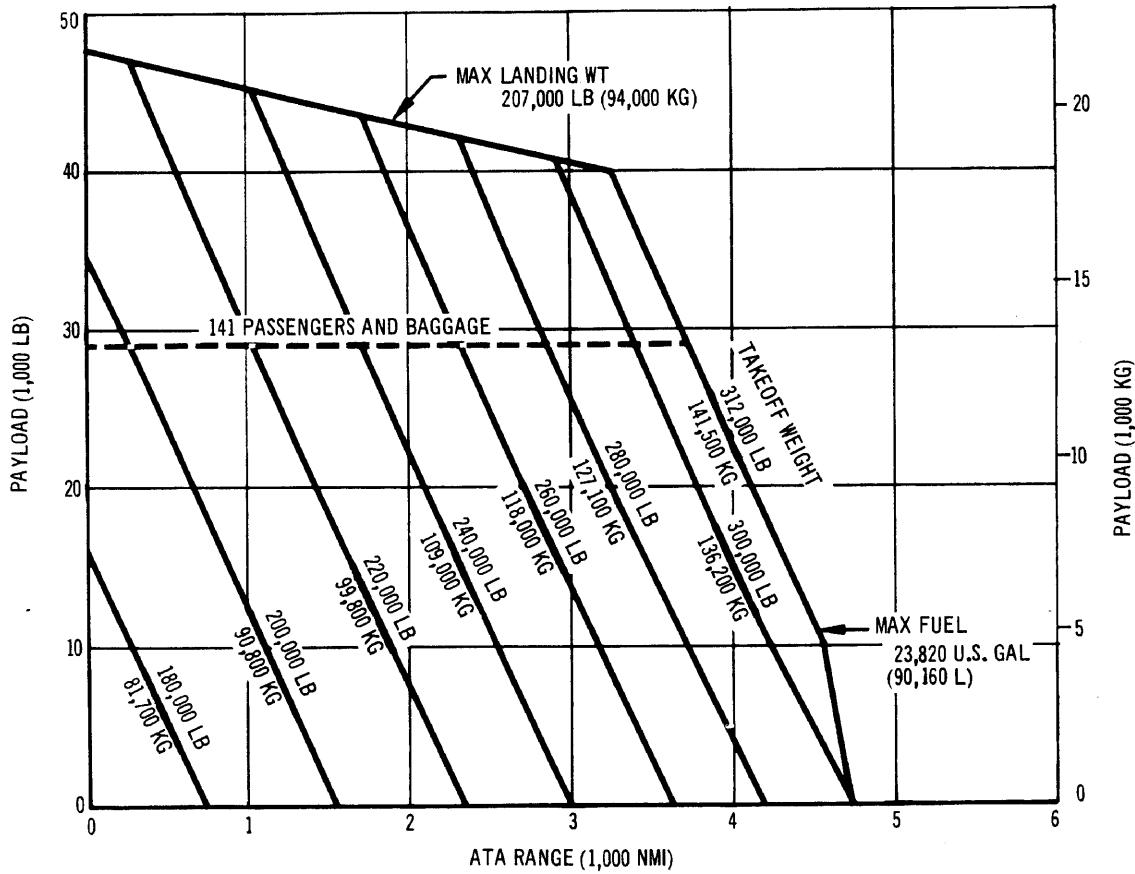

NOTES: ● OEW = 148,300 LB (67,300 KG), AN AVERAGE AIRLINE VALUE;
IF SPECIFIC FIGURES ARE REQUIRED, CONSULT USING AIRLINE.

- JT3D-3B (IC) ENGINES
- STANDARD DAY • ZERO WIND
- ATA INTERNATIONAL FUEL RESERVES - 200 NAUTICAL MILE ALTERNATE

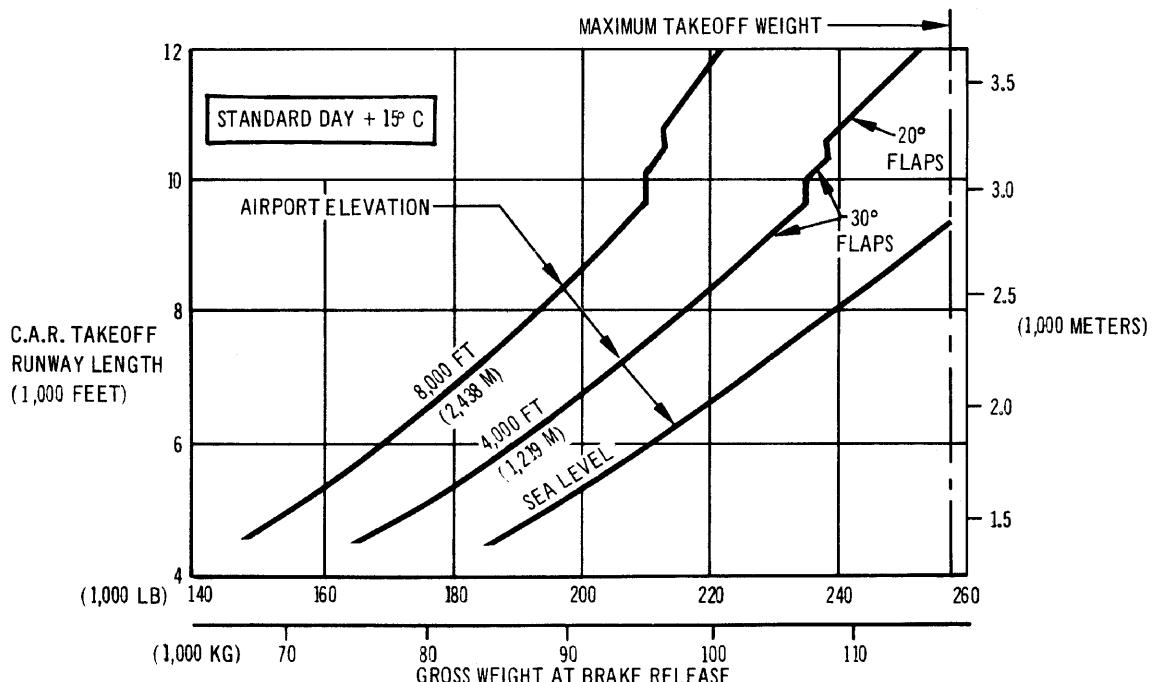

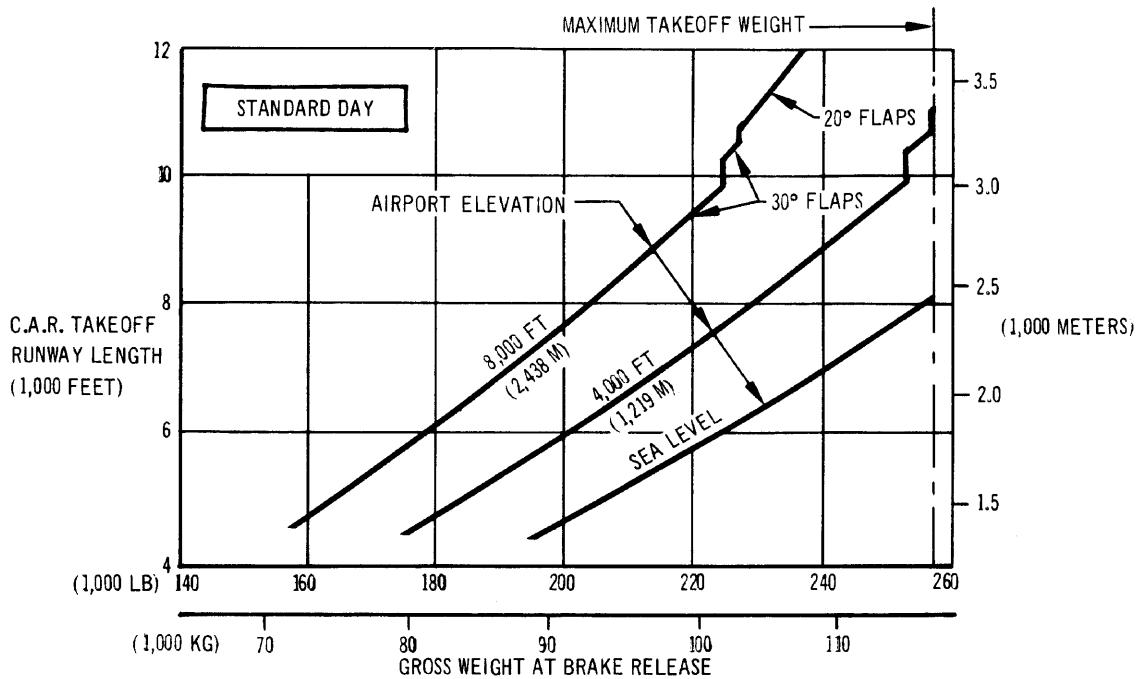

PAYOUT/RANGE FOR LONG RANGE STEP CLIMB CRUISE
MODEL 707-320C CONVERTIBLE - ALL CARGO - INTERNATIONAL

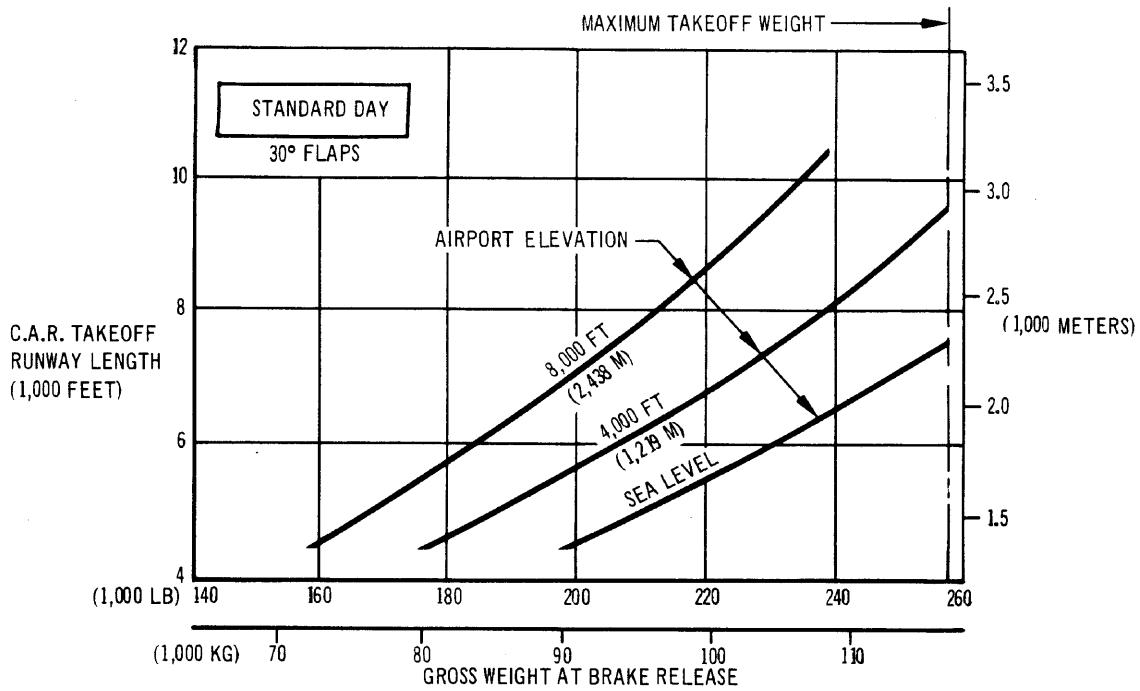

- NOTES:
- OEW = 142,600 LB (64,600 KG), AN AVERAGE AIRLINE VALUE;
IF SPECIFIC FIGURES ARE REQUIRED, CONSULT USING AIRLINE.
 - R. CO. - 12 ENGINES
 - STANDARD DAY - ZERO WIND
 - ATA INTERNATIONAL FUEL RESERVES - 200 NAUTICAL MILE ALTERNATE

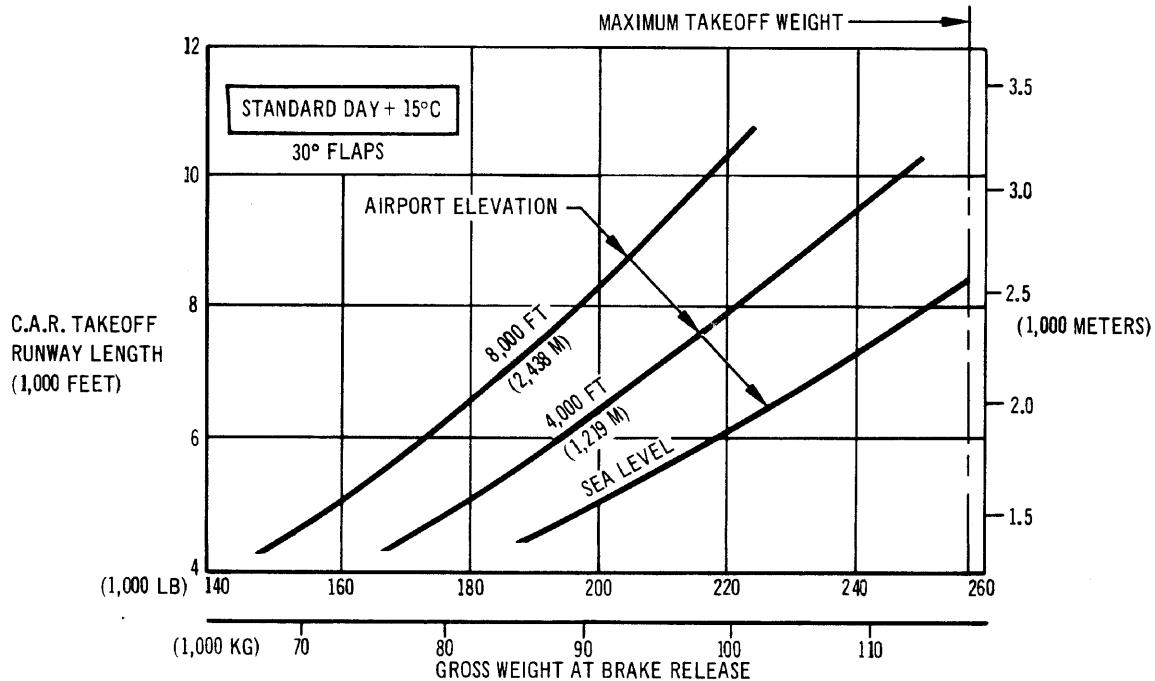

PAYOUT/RANGE FOR LONG RANGE STEP CLIMB CRUISE
MODEL 707-420 PASSENGER - INTERNATIONAL

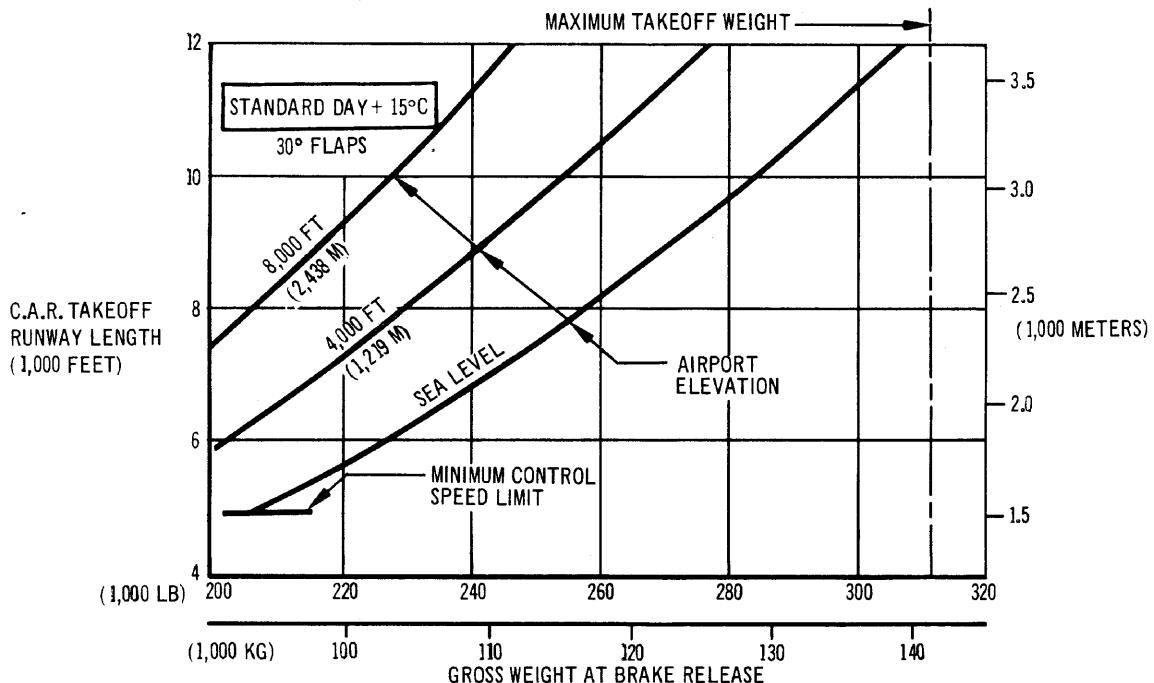

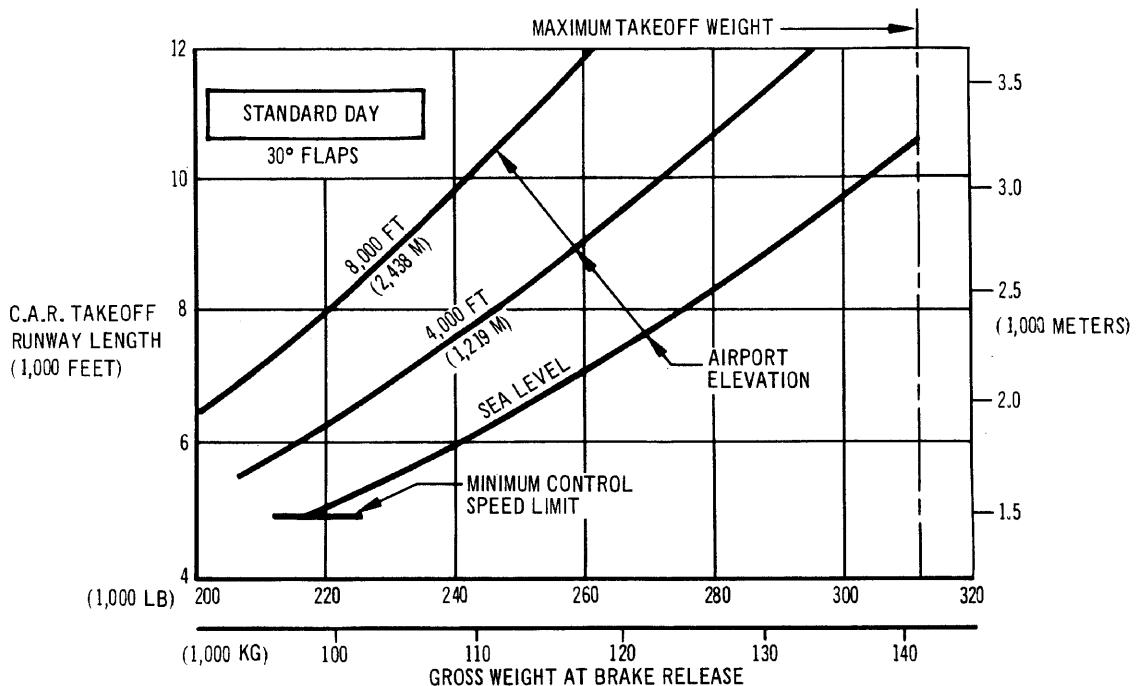

3.2 C.A.R. TAKEOFF RUNWAY LENGTH REQUIREMENTS MODEL 707-120B (JT3D-1 ENGINE)

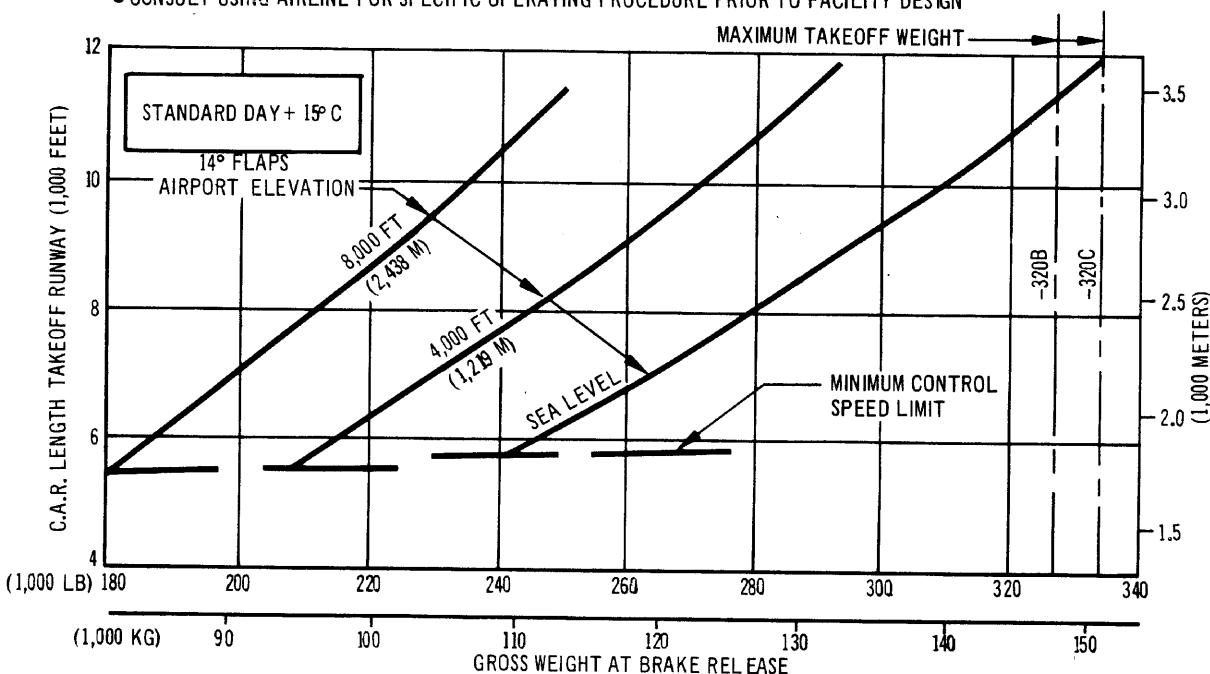

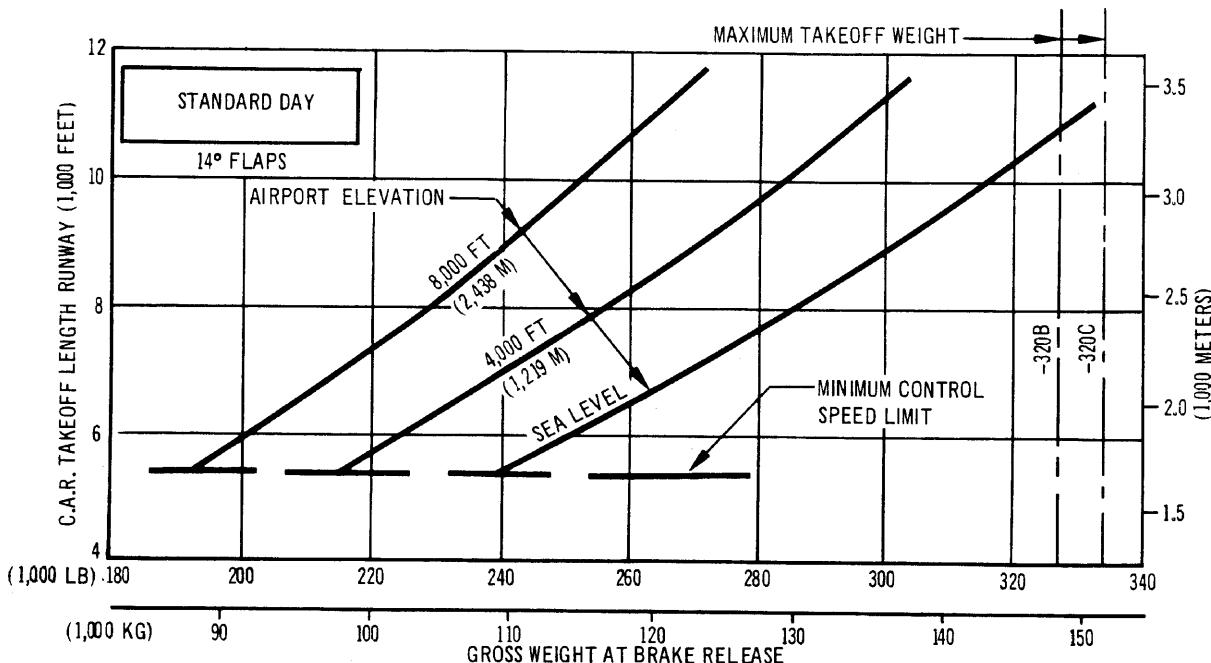

- NOTES:
- JT3D-3 ENGINES (DRY), TWO TURBOCOMPRESSORS ON
 - TAKEOFF NET THRUST = 18,000 LB (8,172 KG) SEA LEVEL STATIC RATING
 - ZERO RUNWAY GRADIENT
 - CONSULT USING AIRLINE FOR SPECIFIC OPERATING PROCEDURE PRIOR TO FACILITY DESIGN

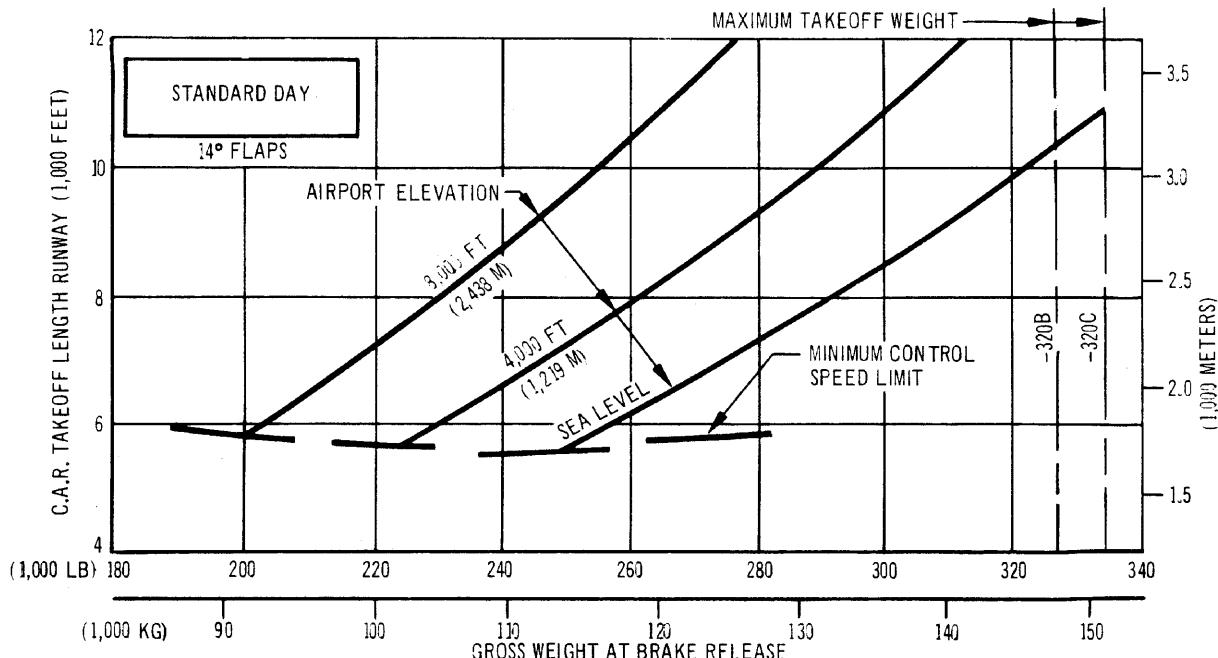

C.A.R. TAKEOFF RUNWAY LENGTH REQUIREMENTS
MODEL 707-120B (JT3D-3 ENGINE)

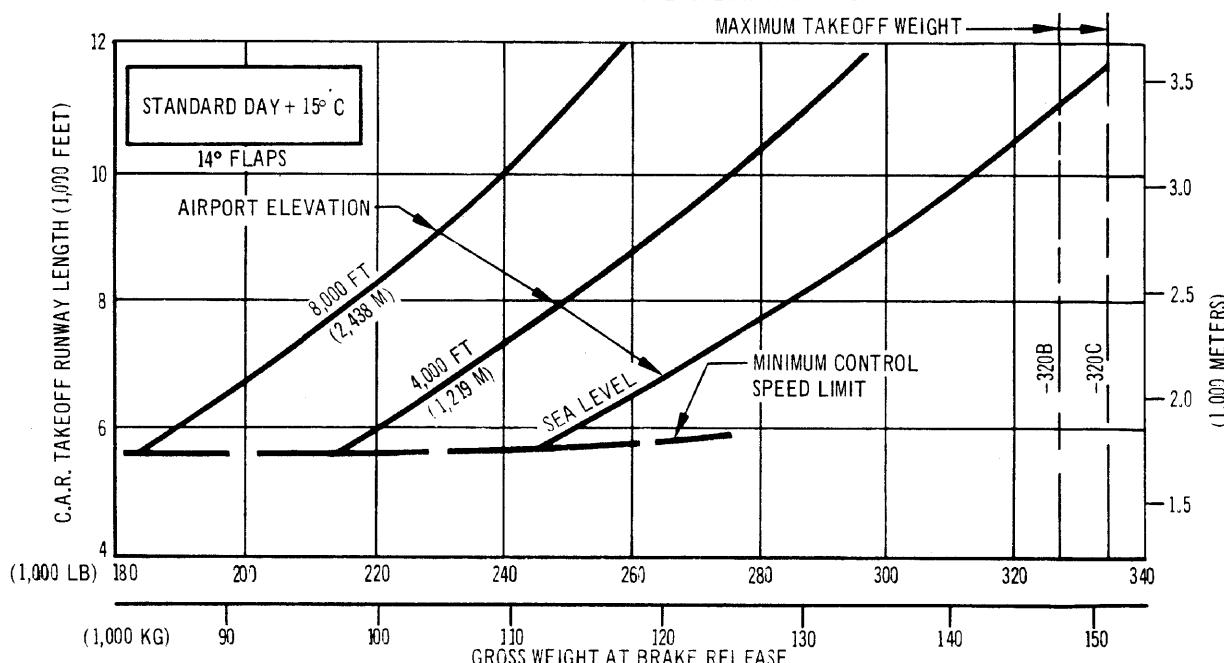

C.A.R. TAKE OFF RUNWAY LENGTH REQUIREMENTS
MODEL 707-320 (JT4A-11, -12 ENGINES)

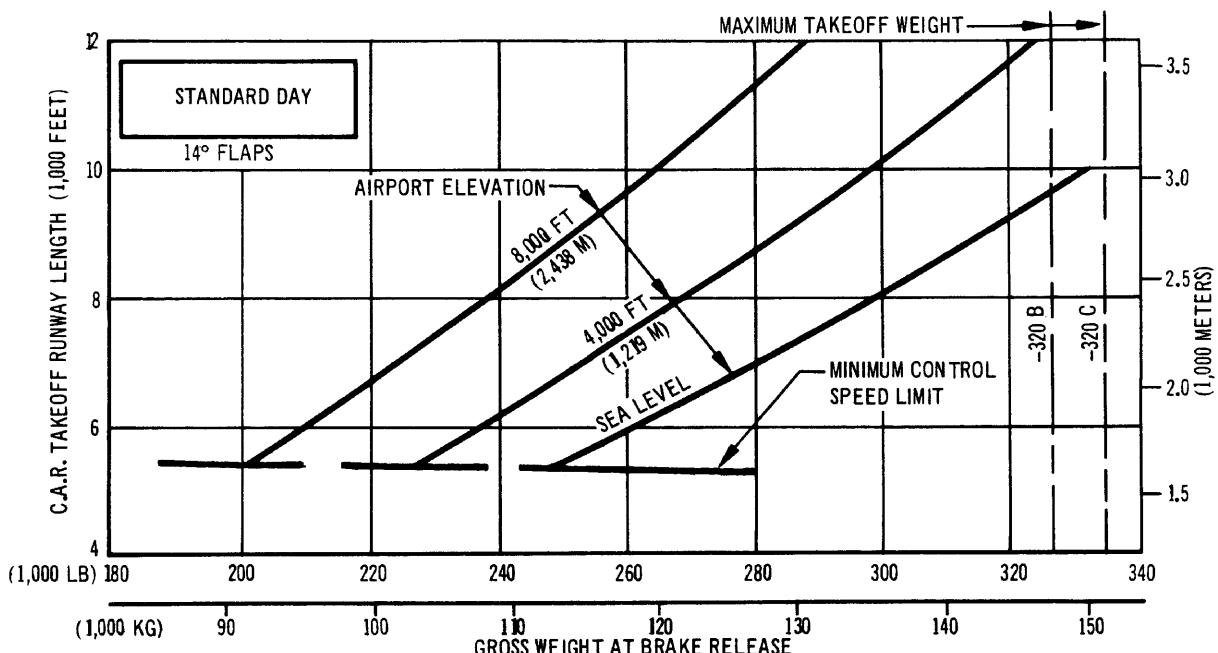

C.A.R. TAKEOFF RUNWAY LENGTH REQUIREMENTS
MODELS 707-320B ADVANCED, -320C (JT3D-3B ENGINES - SMALL COWL DOORS)

NOTES: • JT3D-3B ENGINES (DRY) - IMPROVED COWL DOORS, TURBOCOMPRESSORS OFF
 • TAKEOFF NET THRUST = 18,000 LB (8,172 KG) SEA LEVEL STATIC RATING
 • ZERO RUNWAY GRADIENT
 • CONSULT USING AIRLINE FOR SPECIFIC OPERATING PROCEDURE PRIOR TO FACILITY DESIGN

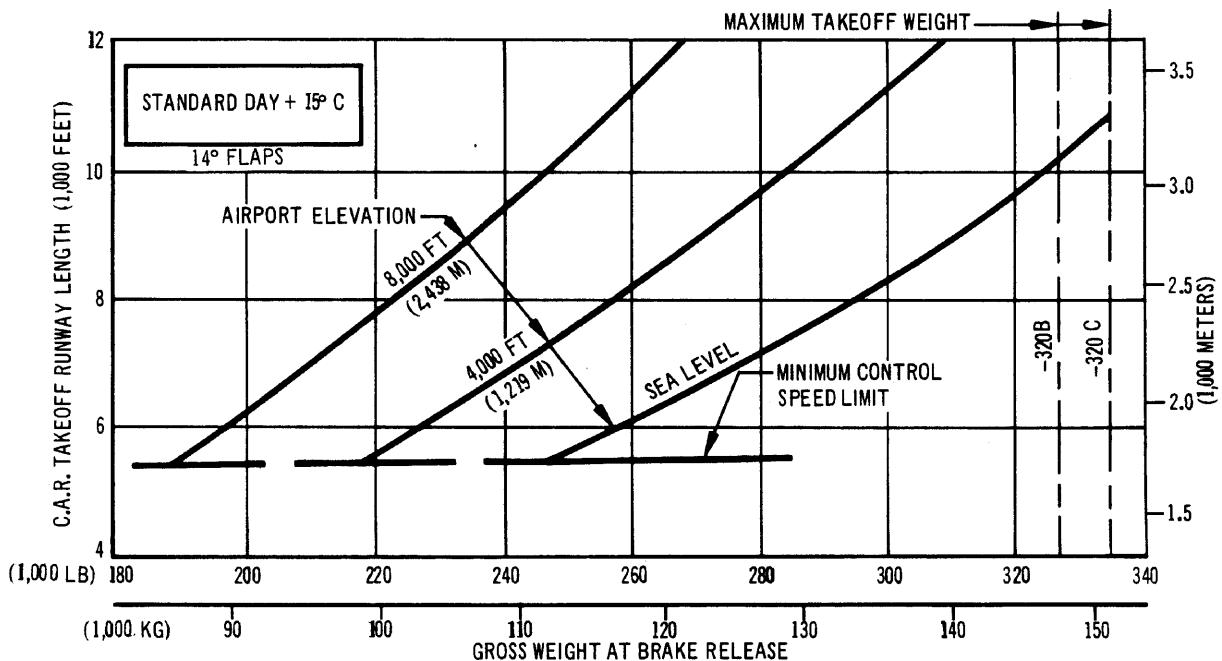

C.A.R. TAKE OFF RUNWAY LENGTH REQUIREMENTS
 MODEL 707-320B ADVANCED, -320C (JT3D-3B ENGINES - IMPROVED COWL DOORS)

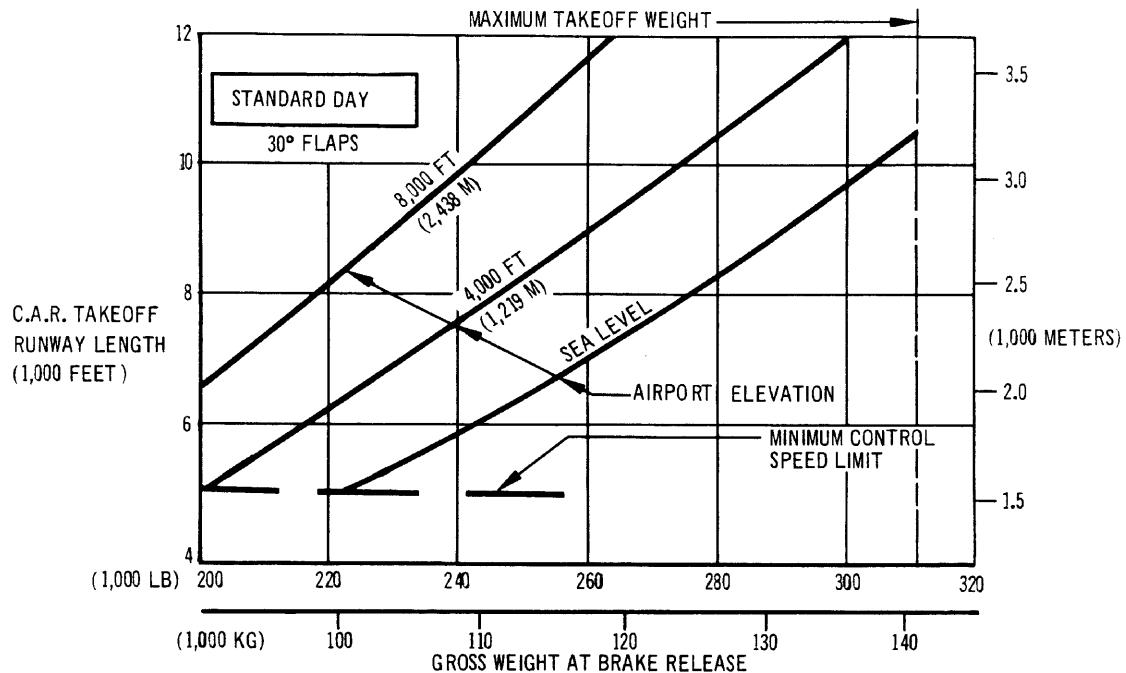

NOTES:

- JT3D-7 ENGINES (DAY) - IMPROVED COWL DOORS, TURBOCOMPRESSORS OFF
- TAKEOFF NET THRUST = 19,000 LB (8,626 KG) SEA LEVEL STATIC RATING
- ZERO RUNWAY GRADIENT
- CONSULT USING AIRLINE FOR SPECIFIC OPERATING PROCEDURE PRIOR TO FACILITY DESIGN

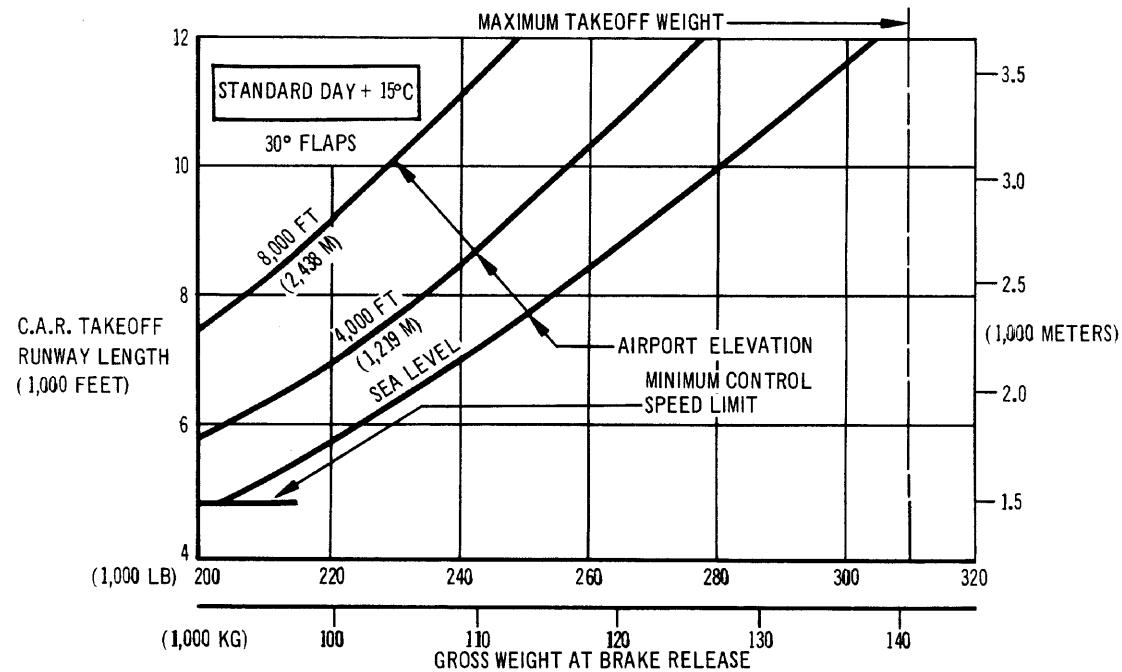

C.A.R. TAKEOFF RUNWAY LENGTH REQUIREMENTS
MODELS 707-320B ADVANCED, -320C (JT3D-7 ENGINE - IMPROVED COWL DOORS)

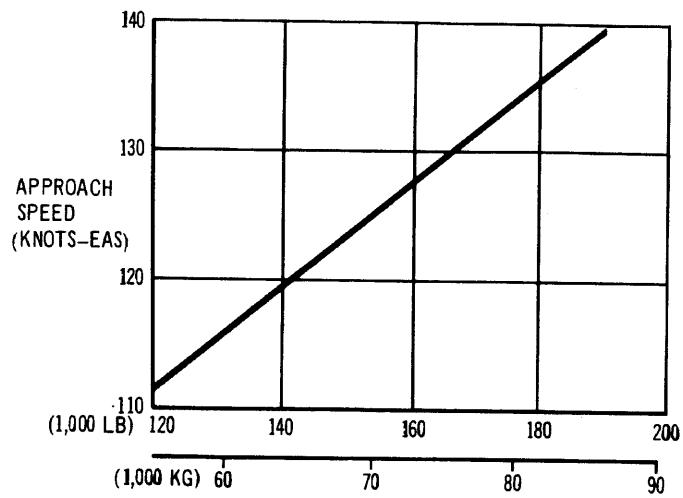

NOTES:

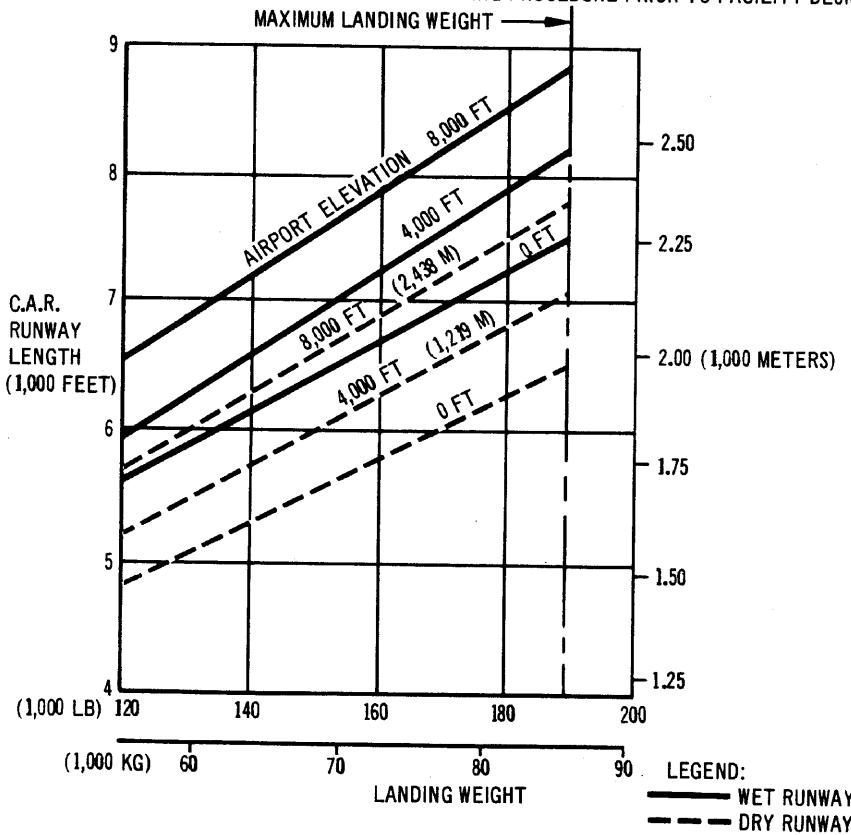

- R.Co. - 12 ENGINES, ONE TURBOCOMPRESSOR ON
- TAKEOFF NET THRUST = 17,500 LB (7,945 KG) SEA LEVEL STATIC RATING
- ZERO RUNWAY GRADIENT
- CONSULT USING AIRLINE FOR SPECIFIC OPERATING PROCEDURE PRIOR TO FACILITY DESIGN

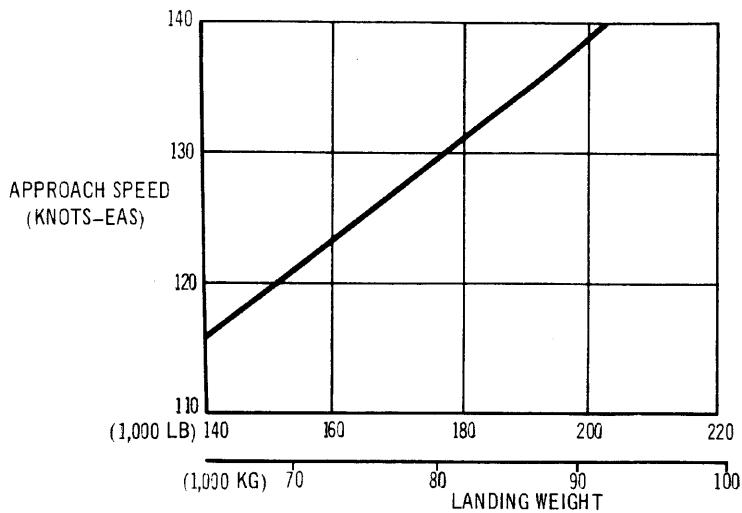

C.A.R. TAKEOFF RUNWAY LENGTH REQUIREMENTS
MODEL 707-420

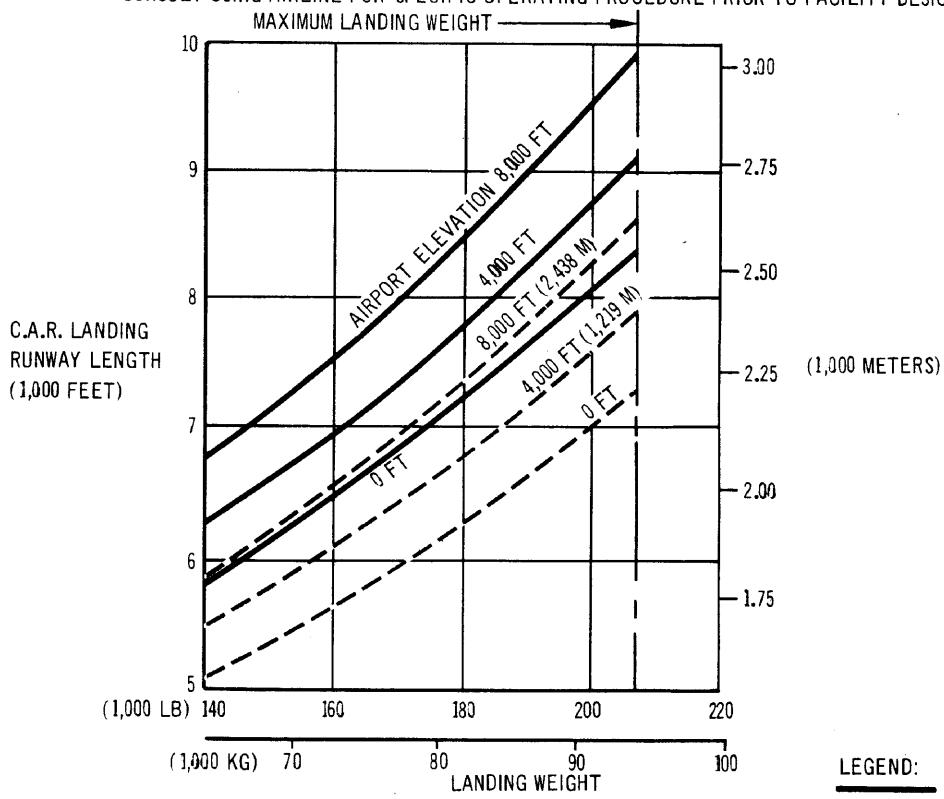

NOTES: • STANDARD DAY
 • ZERO RUNWAY GRADIENT
 • CONSULT USING AIRLINE FOR SPECIFIC OPERATING PROCEDURE PRIOR TO FACILITY DESIGN

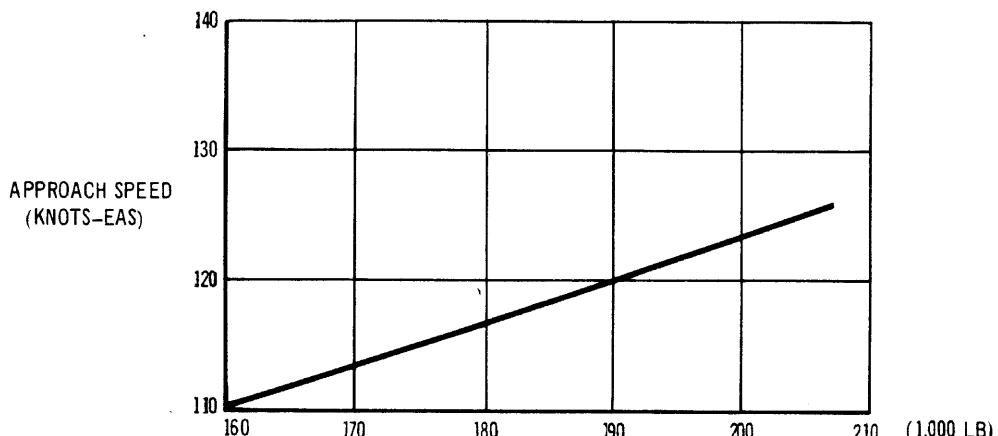

3.3 C.A.R. LANDING RUNWAY LENGTH REQUIREMENTS MODEL 707-120B

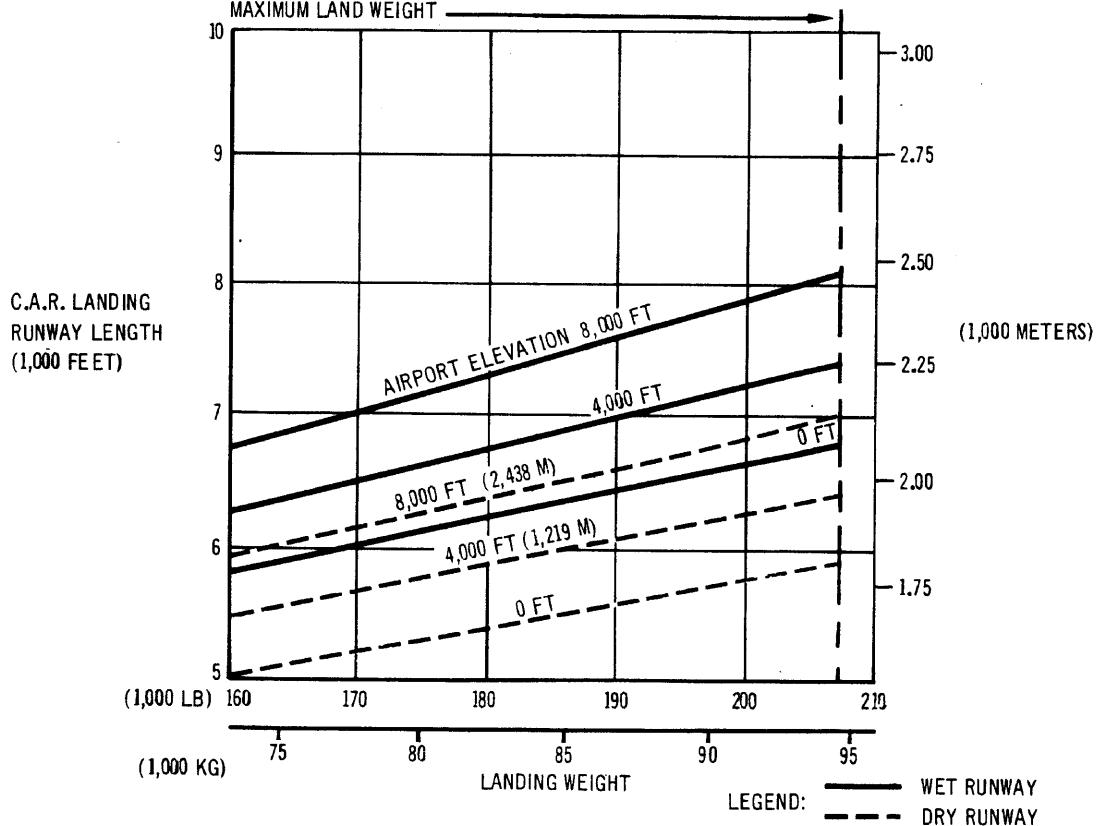

NOTES: • STANDARD DAY
 • ZERO RUNWAY GRADIENT
 • CONSULT USING AIRLINE FOR SPECIFIC OPERATING PROCEDURE PRIOR TO FACILITY DESIGN

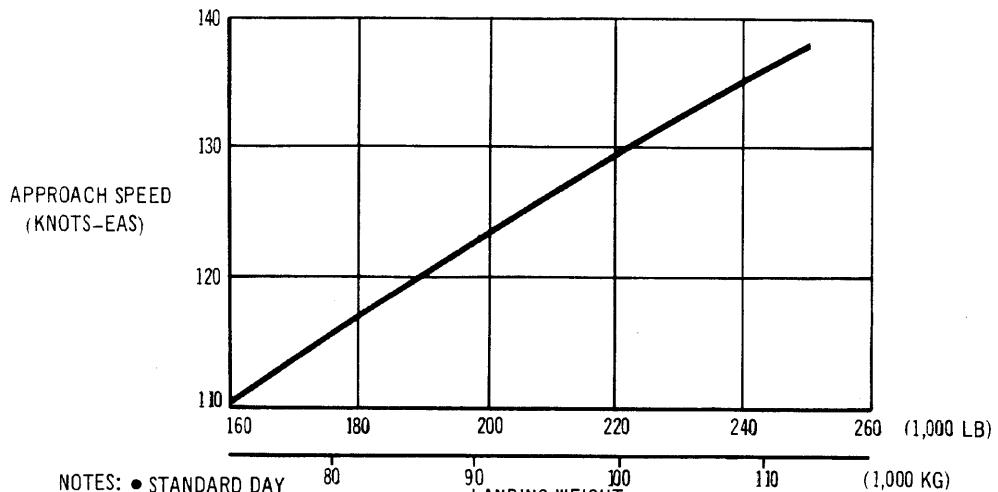

C.A.R. LANDING RUNWAY LENGTH REQUIREMENTS MODEL 707-320

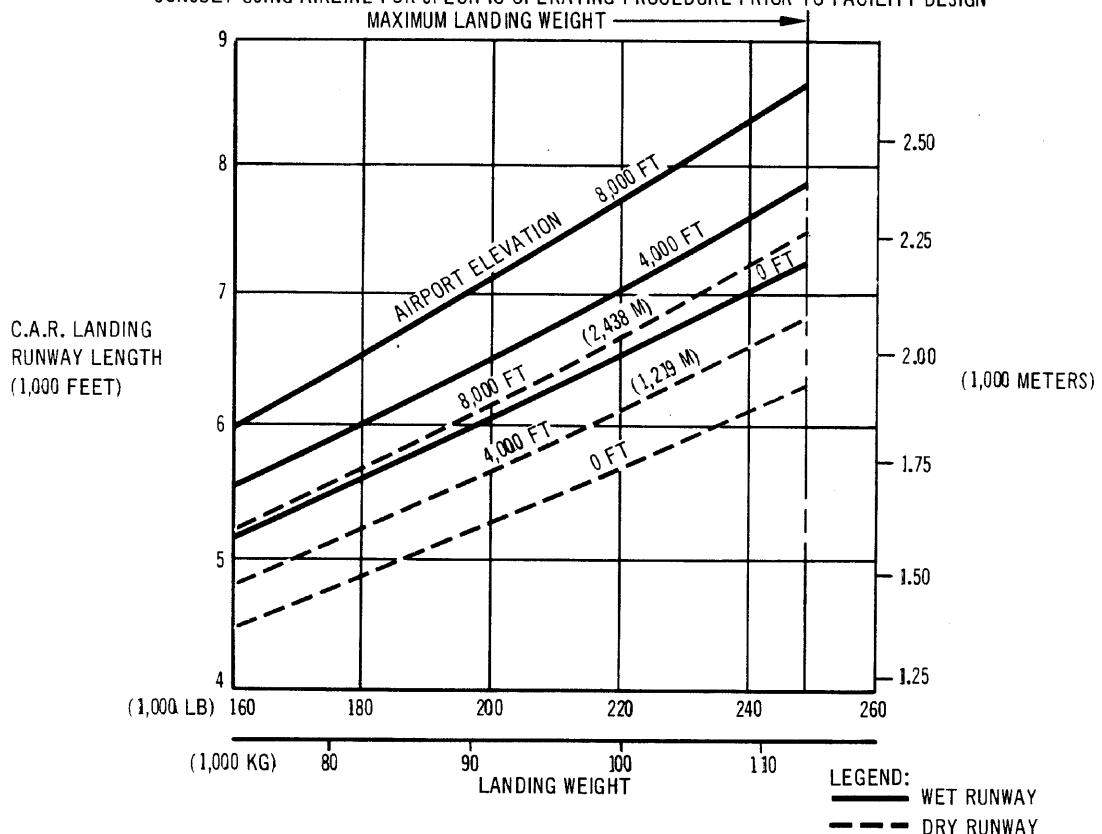

NOTES: ● STANDARD DAY 75
 ● ZERO RUNWAY GRADIENT
 ● GOODRICH BRAKES WITH TANDEM PAIRED MARK II ANTI SKID SYSTEMS
 ● CONSULT USING AIRLINE FOR SPECIFIC OPERATING PROCEDURE PRIOR TO FACILITY DESIGN

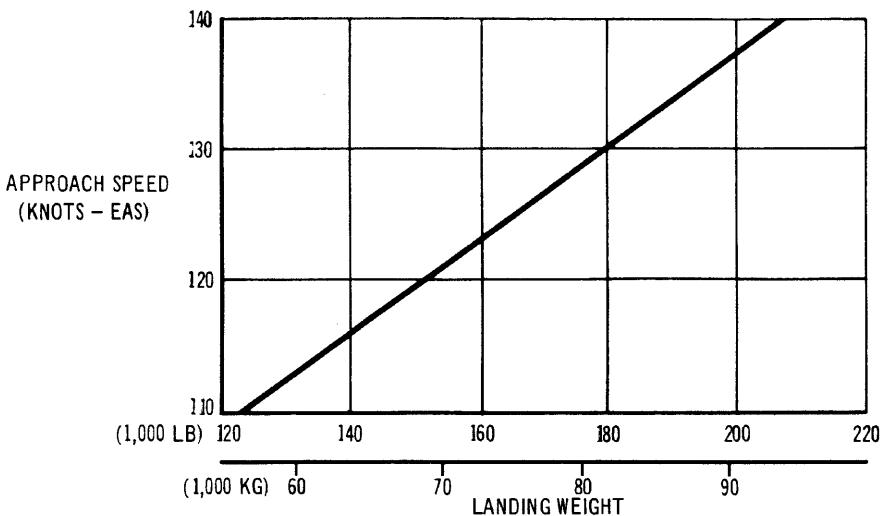

C.A.R. LANDING RUNWAY LENGTH REQUIREMENTS
 MODEL 707-320B ADVANCED

NOTES: • STANDARD DAY 80 90 100 110 (1,000 KG)
• ZERO RUNWAY GRADIENT
• GOODYEAR BRAKES WITH INDIVIDUAL MARK II ANTI SKID ID SYSTEMS
• CONSULT USING AIRLINE FOR SPECIFIC OPERATING PROCEDURE PRIOR TO FACILITY DESIGN

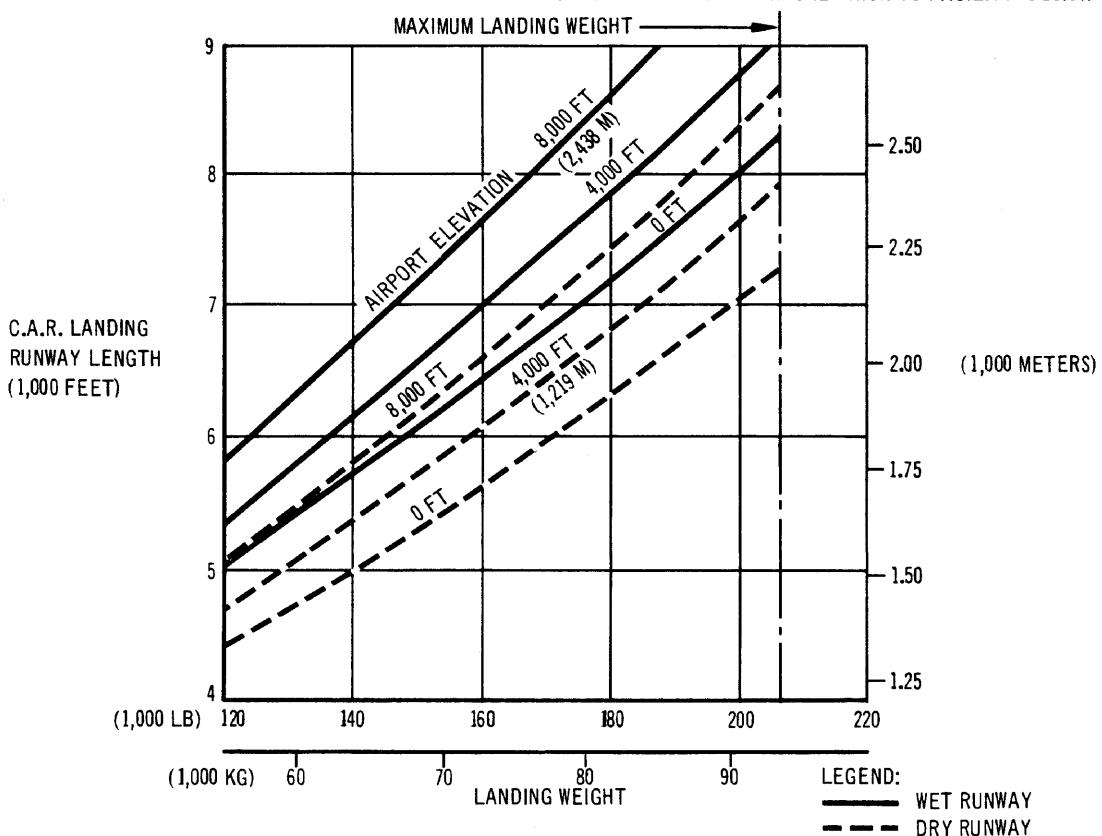

C.A.R. LANDING RUNWAY LENGTH REQUIREMENTS
MODEL 707-320C

NOTES:

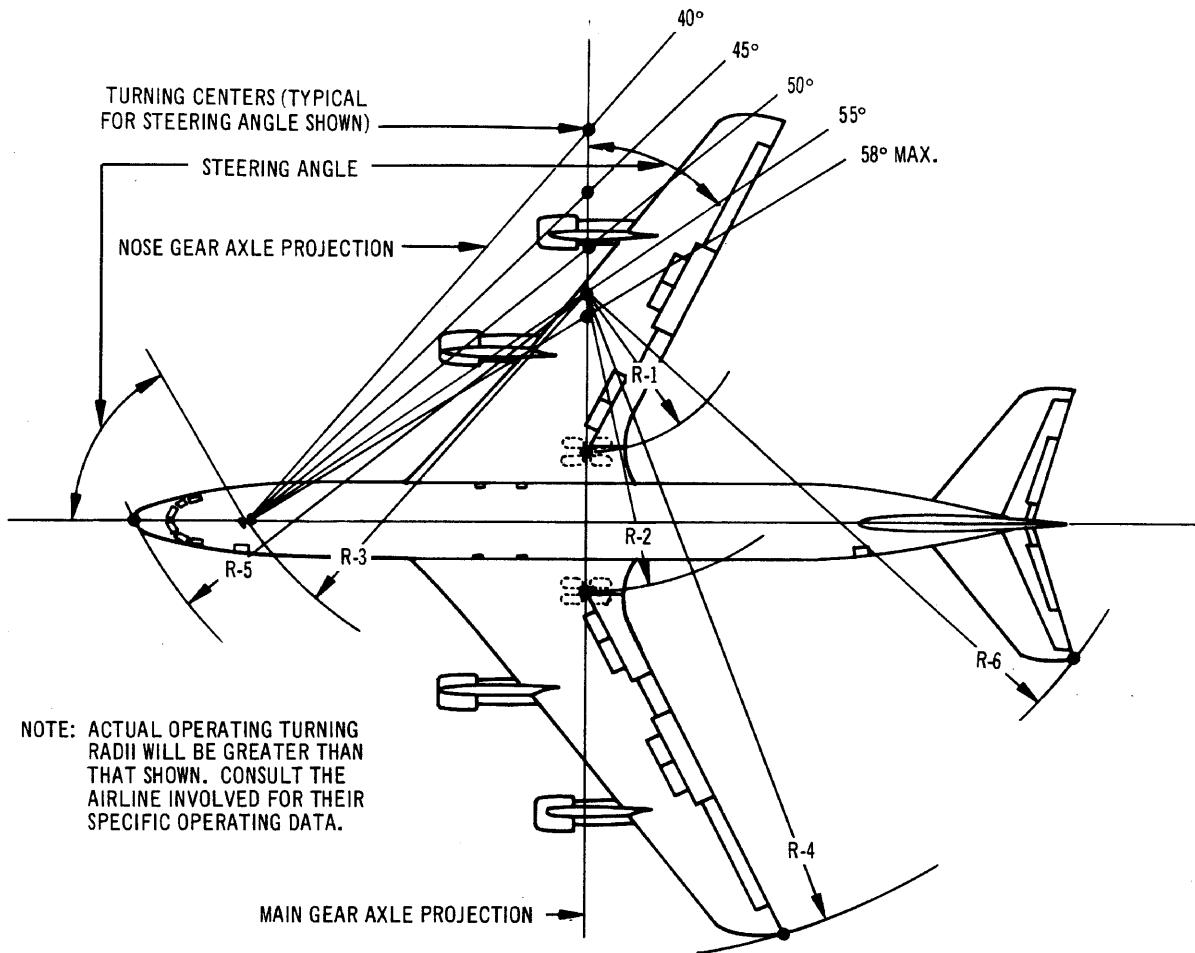

- STANDARD DAY
- ZERO RUNWAY GRADIENT
- CONSULT USING AIRLINE FOR SPECIFIC OPERATING PROCEDURE PRIOR TO FACILITY DESIGN

C.A.R. LANDING RUNWAY LENGTH REQUIREMENTS
MODEL 707-420

4.0 GROUND MANEUVERING

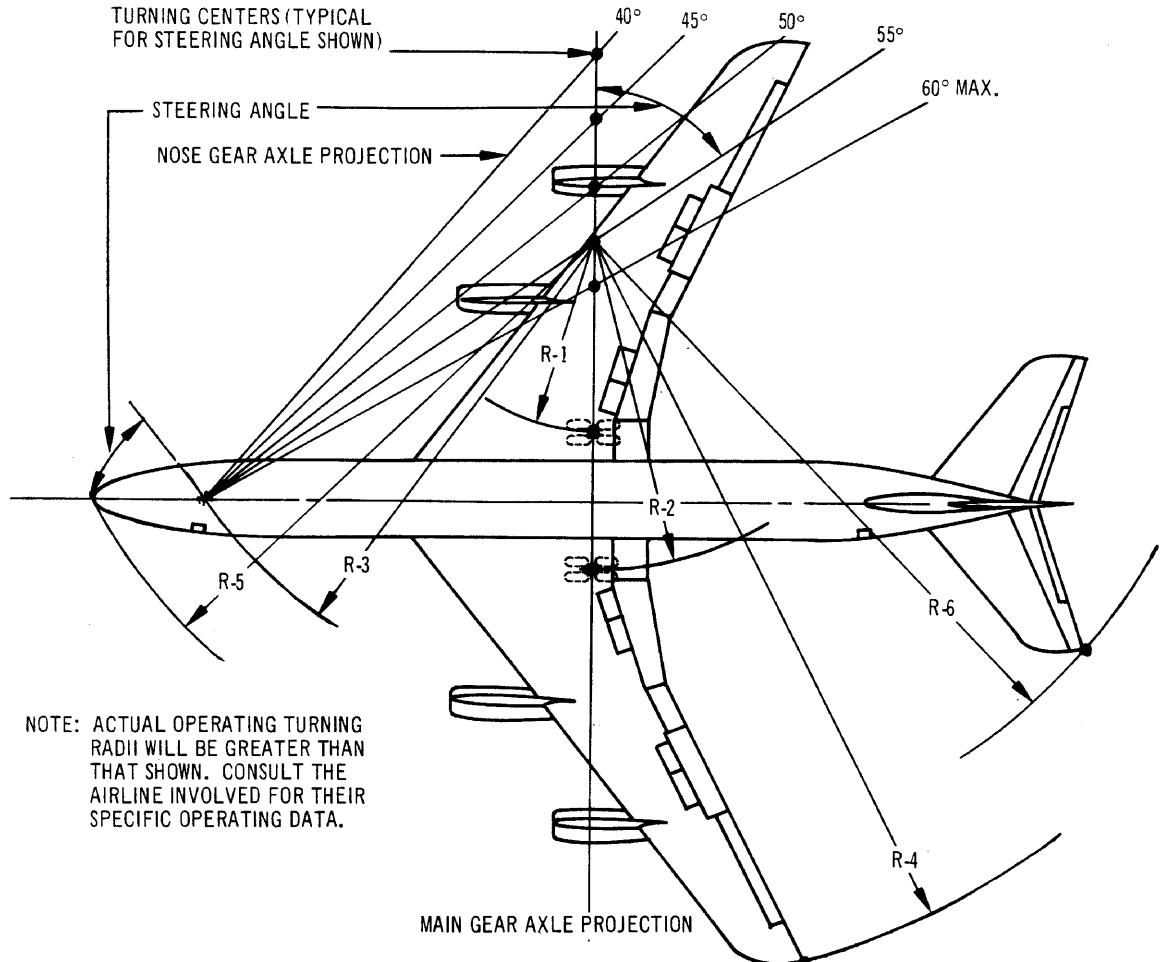

- 4.1 Turning Radii**
- 4.2 Runway and Taxiway Turn Paths**
- 4.3 Runway Holding Apron**
- 4.4 Minimum Parking Space Requirements**

5.5 ENGINE STARTING PNEUMATIC REQUIREMENTS MODELS 707-120B, -320, -320B, -320C, -420

INITIAL CABIN TEMPERATURE AT 0°F (-17.8°C). NO GALLEY LOAD. NO ELECTRICAL LOAD. NO CREW OR PASSENGERS. TEMPERATURE AT GROUND CONNECTION IS 450°F (232.2°C).

INITIAL CABIN TEMPERATURE AT 103°F (39.4°C). OUTSIDE AIR TEMPERATURE AT 103°F. SOLAR LOAD 5,100 BTU/HOUR (1,280 KG CAL./HOUR). NO GALLEY LOAD. NO CREW OR PASSENGERS. NO ELECTRICAL LOAD. TEMPERATURE AT GROUND CONNECTION IS 450°F (232.2°C).

NOTES:

- P = ABSOLUTE PRESSURE AT THE GROUND CONNECTION

- ALL DOORS AND HATCHES CLOSED

5.6 AIR CONDITIONING REQUIREMENTS - PULL UP/PULL DOWN MODEL 707-120B

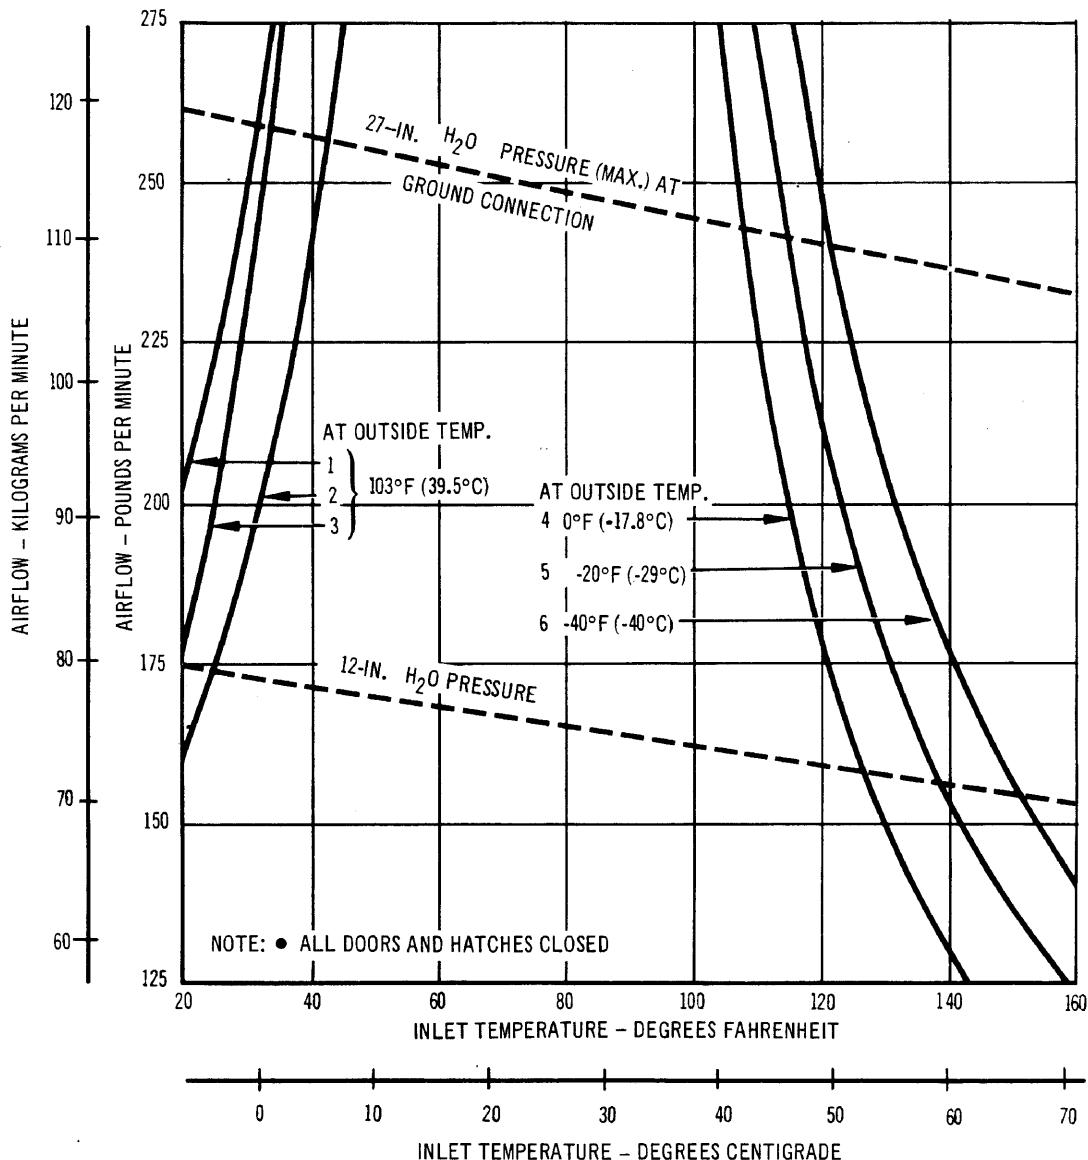

CONDITIONS:

1 CABIN AT 75°F (24°C). 120 PASSENGERS AND CREW. NO GALLEY LOAD. BRIGHT DAY SOLAR LOAD 5,100 BTU/HOUR (1,280 KG CAL./HOUR). ELECTRICAL LOAD 8,000 BTU/HOUR (2,020 KG CAL./HOUR).

2 CABIN AT 80°F (26.7°C). ALL OTHER CONDITIONS SAME AS IN 1.

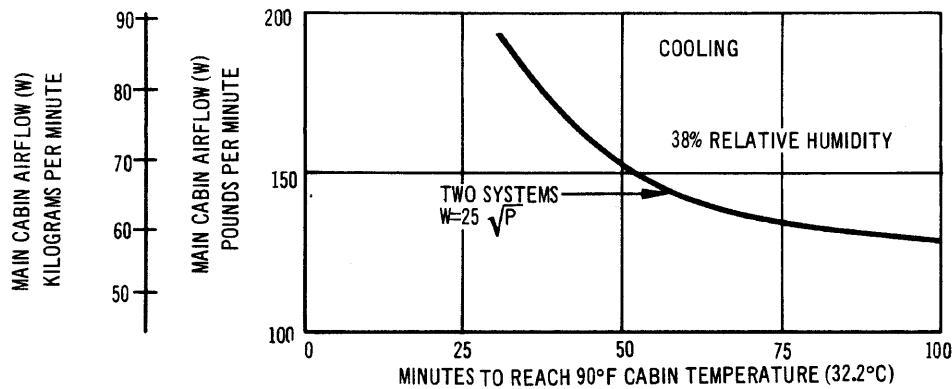

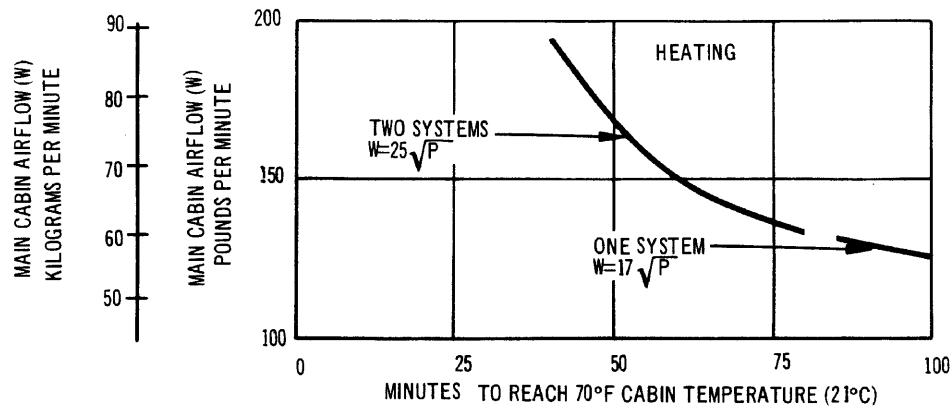

3 CABIN AT 70°F (21°C). THREE CREW MEMBERS ONLY. GALLEY LOAD 8,000 BTU/HOUR. BRIGHT DAY SOLAR LOAD 5,100 BTU/HOUR. ELECTRICAL LOAD 8,000 BTU/HOUR.

4, 5 AND 6 CABIN AT 75°F (24°C). NO CREW OR PASSENGERS, NO OTHER HEAT LOAD

AIR CONDITIONING REQUIREMENTS - PRE-CONDITIONED AIRPLANE
MODEL 707-120B

INITIAL CABIN TEMPERATURE AT 0°F (-17.8°C). NO GALLEY LOAD. NO ELECTRICAL LOAD. NO CREW OR PASSENGERS. TEMPERATURE AT GROUND CONNECTION IS 450°F (232.2°C).

INITIAL CABIN TEMPERATURE AT 103°F (39.4°C). OUTSIDE AIR TEMPERATURE AT 103°F. SOLAR LOAD 5,500 BTU/HOUR (1,380 KG CAL/HOUR). NO GALLEY LOAD. NO CREW OR PASSENGERS. NO ELECTRICAL LOAD. TEMPERATURE AT GROUND CONNECTION IS 450°F (232.2°C).

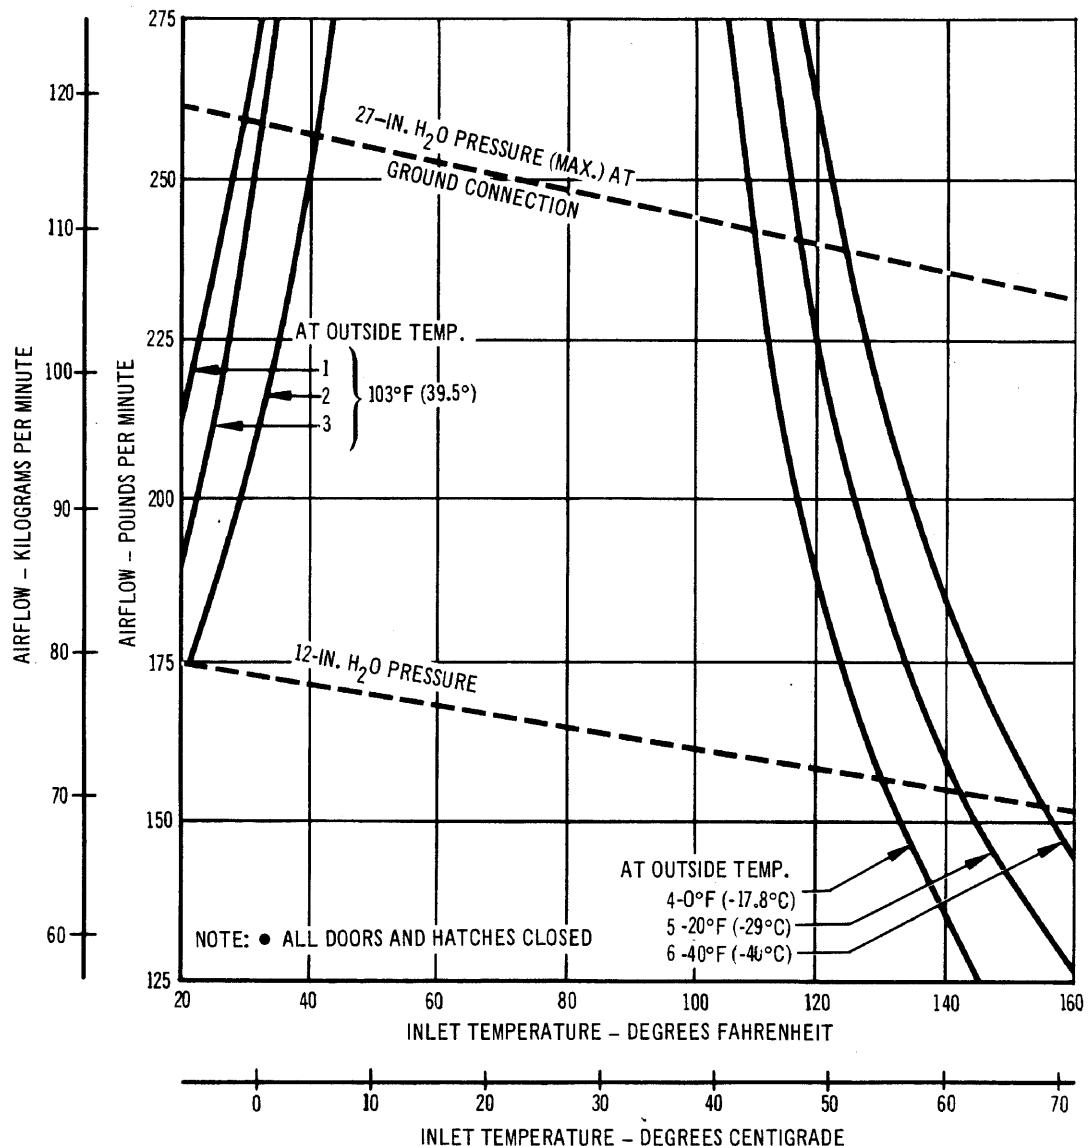

NOTES:

- P = ABSOLUTE PRESSURE AT THE GROUND CONNECTION.
- ALL DOORS AND HATCHES CLOSED

AIR CONDITIONING REQUIREMENTS - PULL UP/PULL DOWN
MODELS 707-320, -320B, -320C, -420

CONDITIONS:

- 1 CABIN AT 75°F (24°C). 130 PASSENGERS AND CREW. NO GALLEY LOAD. BRIGHT DAY SOLAR LOAD 5,000 BTU/HOUR (1,260 KG CAL./HOUR). ELECTRICAL LOAD 9,000 BTU/HOUR, (2,370 KG CAL./HOUR).
- 2 CABIN AT 80°F (26.7°C). ALL OTHER CONDITIONS SAME AS IN 1.
- 3 CABIN AT 70°F (21°C). THREE CREW MEMBERS ONLY. GALLEY LOAD 8,200 BTU/HOUR (2,060 KG CAL./HOUR). BRIGHT DAY SOLAR LOAD 5,500 BTU/HOUR (1,275 KG CAL/HOUR). ELECTRICAL LOAD 8,800 BTU/HOUR (2,220 KG CAL./HOUR).
- 4, 5 AND 6 CABIN AT 75°F (24°C) NO CREW OR PASSENGERS. NO OTHER HEAT LOAD.

AIR CONDITIONING REQUIREMENTS - PRECONDITIONED AIRPLANE
MODELS 707-320, -320B, -320C, -420

5.7 GROUND TOWING REQUIREMENTS

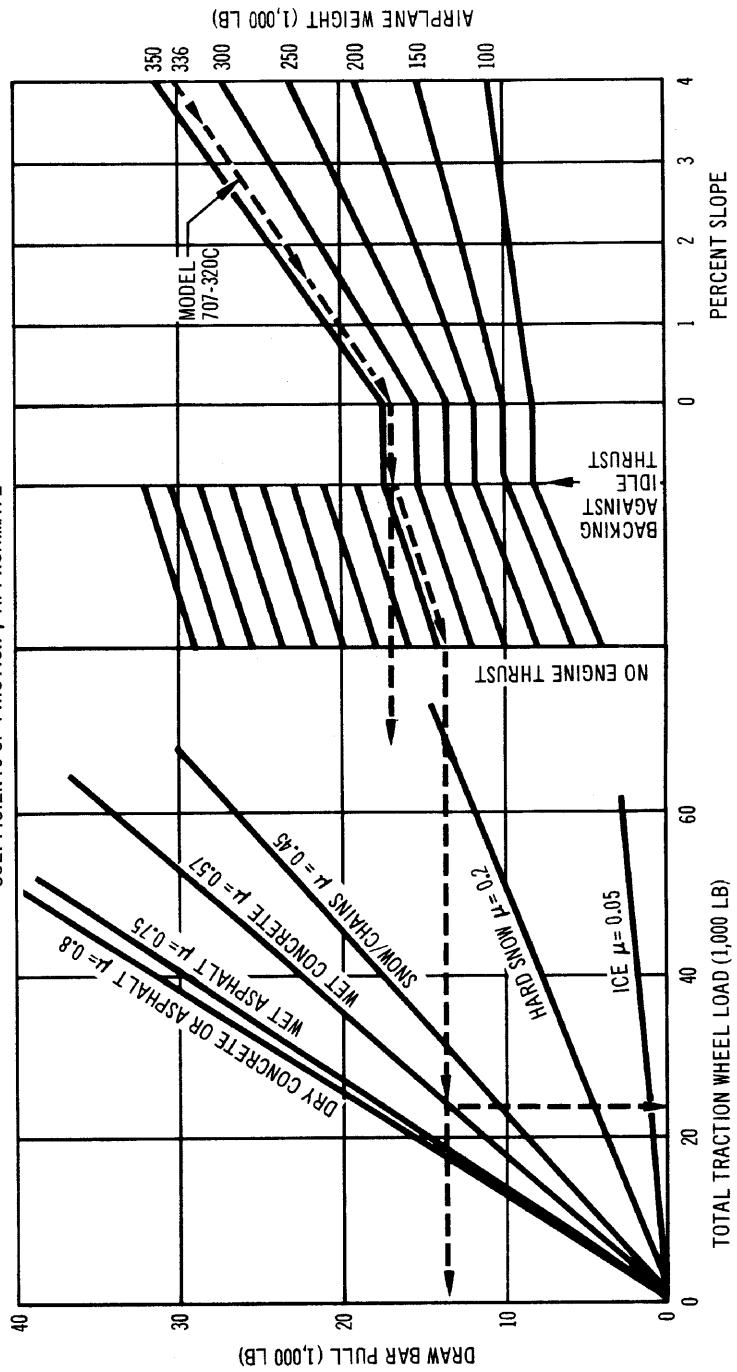

Ground towing requirements for various towing conditions are presented on pages 90 and 91.

Draw bar pull and total traction wheel load may be determined considering airplane weight, pavement slope and coefficient of friction and engine idle thrust.

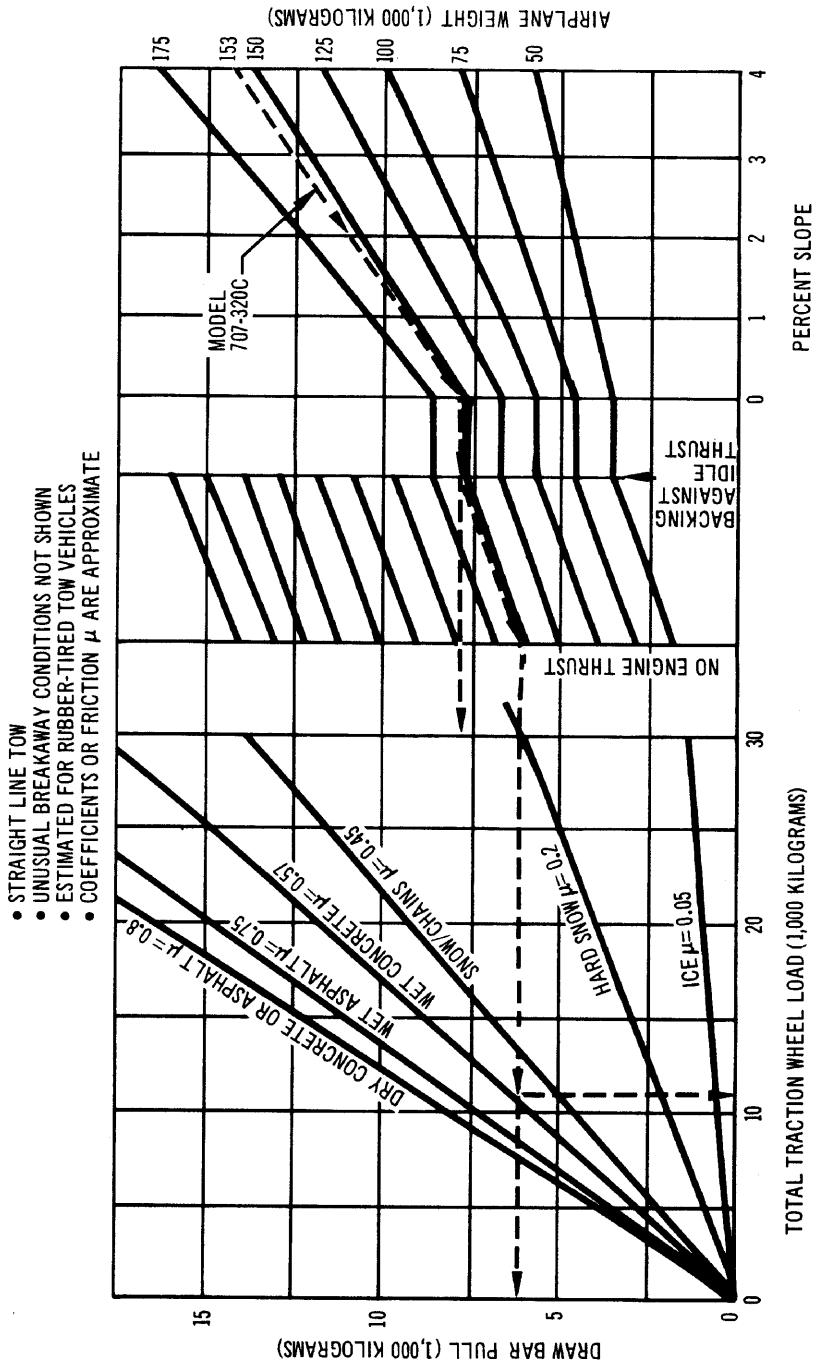

EXAMPLE:

An example is illustrated on page 90 for the model 707 - 320C with a maximum taxi weight of 336,000 pounds and engines off (no engine thrust). Assuming the pavement to be wet concrete with zero slope, the required total traction wheel load would be 23,600 pounds; the draw bar pull would be 13,400 pounds. Note, when backing against idle thrust, these numbers would change to 29,000 and 16,500 pounds respectively.

6.2 AIRPORT AND COMMUNITY NOISE

Noise level footprint contours will be developed and displayed in the document at some future date. These contours will reflect the noise level impingement upon a theoretical ground level plane at the same elevation as the runway. Contours will be provided for both takeoff and landing operations.

These footprint contours will permit investigations at individual airports of the noise associated with operation of the airplane as it relates to the airport proper and the adjoining community. This will assist in planning investigations related to clear zones, zoning for nonsensitive land utilization, or alternate compatible land development.

As an interim measure for airport planning it is recommended that FAA DS-67-14 "Techniques for Developing Noise Exposure Forecasts," with the exception of Section 4 "Land Use Planning," be used as representative of noise contours for 2, 3 and 4 engine airplanes. It must be kept in mind that the data presented is for effective perceived noise level in units of EPNdB, and as such must be considered to have a tolerance of \pm 8 EPNdB.

7.0 PAVEMENT DATA

7.1 General Information

A brief description of the pavement charts that follow will help in their use for airport planning. Each airplane configuration is depicted with a minimum range of four loads imposed on the main landing gear to aid in interpolation between the discrete values shown. All curves for any single chart represent data based on rated loads and tire pressures considered normal and acceptable by current aircraft tire manufacturer's standards. Tire pressures, where specifically designated on tables and charts, are at values obtained under loaded conditions as certificated for commercial use.

Page 116 presents basic data on the landing gear footprint configuration, maximum design taxi loads, and tire sizes and pressures.

Maximum pavement loads for certain critical conditions at the tire-to-ground interface are shown on page 117.

Pavement requirements for commercial airplanes are customarily derived from the static analysis of loads imposed on the main landing gear struts. The chart on page 118 is provided in order to determine these loads throughout the stability limits of the airplane at rest on the pavement. These main landing gear loads are used as the point of entry to the pavement design charts, interpolating load values where necessary.

The flexible pavement design curves (Section 7.5) are based on procedures set forth in Instruction Report No. S-77-1, "Procedures for Development of CBR Design Curves," dated June 1977, and as modified according to the methods described in ICAO Aerodrome Design Manual, Part 3, Pavements, 2nd Edition, 1983, Section 1.1 (The ACN-PCN Method), and utilizing the alpha factors approved by ICAO in October 2007. Instruction Report No. S-77-1 was prepared by the U.S. Army Corps of Engineers Waterways Experiment Station, Soils and Pavements Laboratory, Vicksburg, Mississippi. The line showing 10,000 coverages is used to calculate Aircraft Classification Number (ACN).

Rigid pavement design curves (page 130) have been prepared with the use of the Westergaard equation in general accordance with the procedures outlined in the Design of Concrete Airport Pavement (1955 edition) by Robert G. Packard, published by the American Concrete Pavement Association, 3800 North Wilke Road, Arlington Heights, Illinois 60004-1268. These curves are modified to the format described in the Portland Cement Association publication XP6705-2, Computer Program for Airport Pavement Design (Program PDILB), 1968, by Robert G. Packard.

The following procedure is used to develop rigid pavement design curves such as those shown on page 123.

1. Having established the scale for pavement thickness to the left and the scale for allowable working stress to the right, an arbitrary load line is drawn representing the main landing gear maximum weight to be shown.
2. All values of the subgrade modulus (k -values) are then plotted as shown on page 123.
3. Additional load lines for the incremental values of weight on the main landing gear are then established on the basis of the curve for $k = 300$, already established.

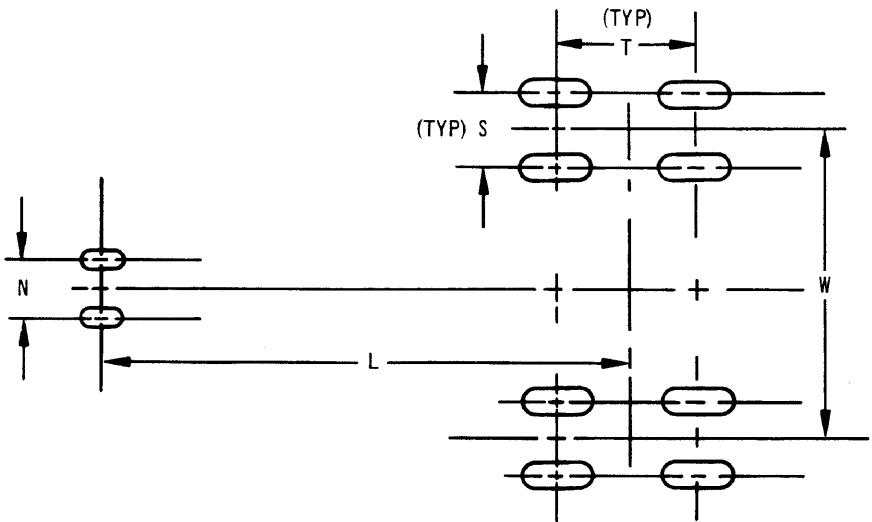

All LCN Curves where shown have been plotted from data in the International Civil Aviation Organization (ICAO) Document 7920-AN/865/2, Aerodrome Manual, Part 2, "Aerodrome Physical Characteristics," 2nd Edition, 1965.

On the same charts showing LCN versus equivalent single wheel load, there are load plots for the 707 family of airplanes showing equivalent single wheel load versus pavement thickness (h) for flexible pavements and versus ℓ (radius of relative stiffness) for rigid pavements.

Procedures and curves provided in the ICAO Aerodrome Manual - Part 2, Chapter 4 are used to determine equivalent single wheel loads for use in making LCN conversion of rigid pavement requirements.

Note: Pavement requirements are presented for loads, tires and tire pressures presently planned for certified commercial usage.

All curves represent data at a constant specified tire pressure.

7.6 FLEXIBLE PAVEMENT REQUIREMENTS—LCN CONVERSION

In order to determine the aircraft weight that can be accommodated on a particular flexible pavement, both the LCN of the pavement and the thickness (h) of the pavement must be known.

In the example for the 707-320B shown on page 126, the flexible pavement thickness is shown at 23.6 inches with an LCN of 72. For these conditions the apparent maximum allowable weight permissible on the main landing gear is 250,000 pounds.

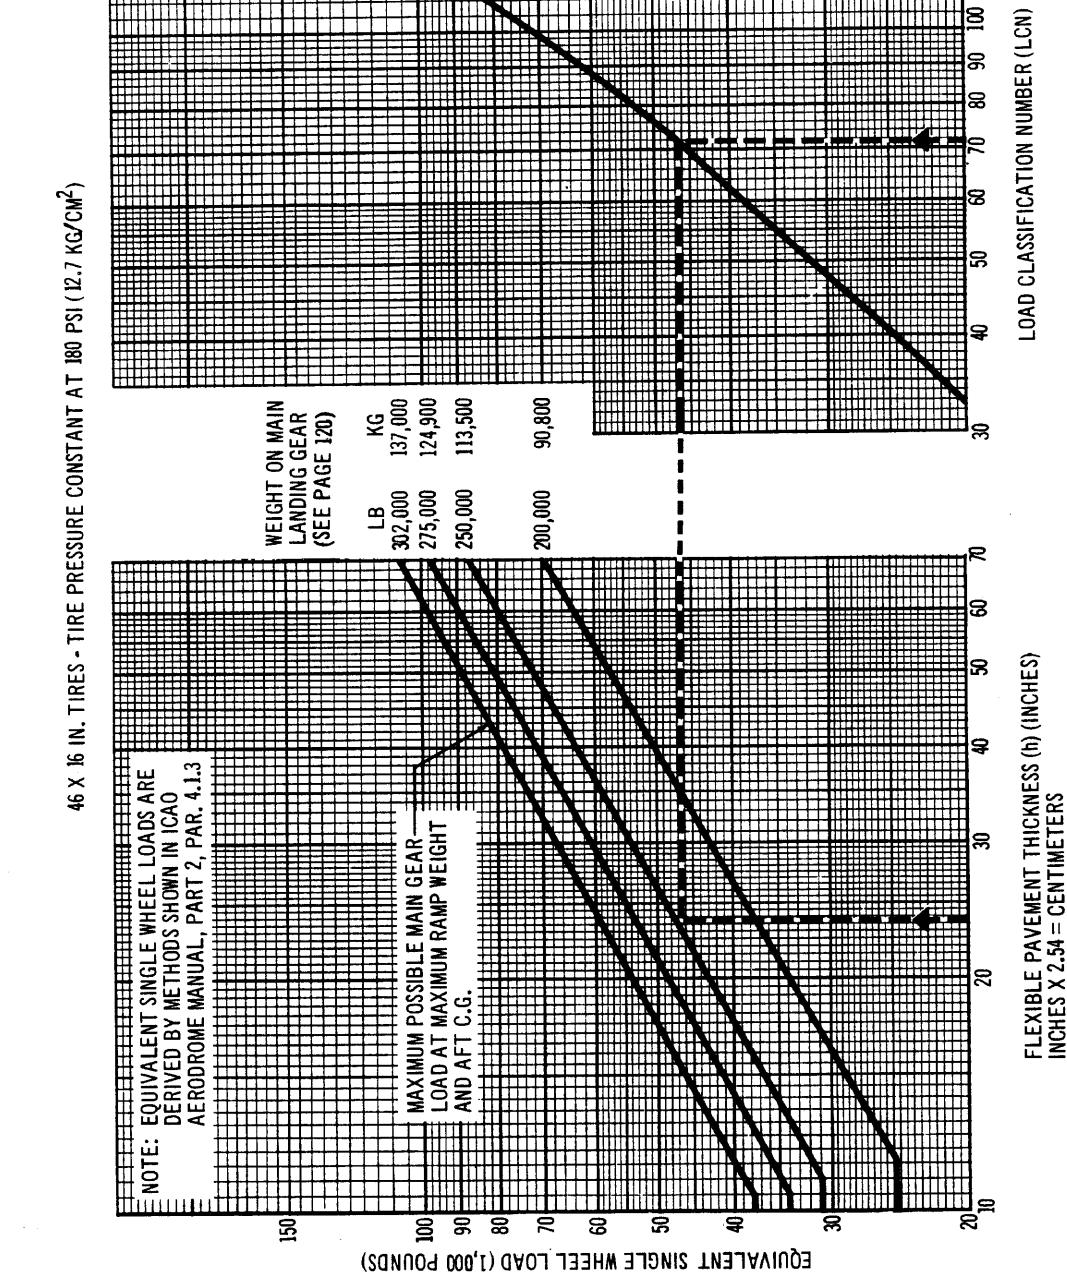

NOTE: Provided that the resultant aircraft LCN is not more than 10 percent above the published pavement LCN, the United Kingdom considers the bearing strength of the pavement to be sufficient for unlimited use by the aircraft. The figure of 10 percent has been chosen as representing the lowest degree of variation in LCN that is significant. (Reference: ICAO Aerodrome Manual, Part 2, Aerodrome Physical Characteristics, Chapter 4, Paragraph 4.1.5.7v.)

7.7 RIGID PAVEMENT REQUIREMENTS — PORTLAND CEMENT ASSOCIATION DESIGN METHOD

Rigid pavement requirements, herein presented, are based upon two Portland Cement Association practices:

1. The former, standard manual method of counting unit moment blocks on the Pickett and Ray influence charts (Reference: Portland Cement Association publication "The Design of Concrete Airport Pavement" dated 1955)
2. The new computerized version of the above as described in document XP-6705 "Computer Program for Airport Pavement Design" by Robert G. Packard, Portland Cement Association, 1967

Higher stresses for equivalent pavement thicknesses are obtained by the computerized method. These occur because of the following:

1. Increased Radius of Influence

The effect of influence from adjacent wheels by the manual method was limited to approximately 2 times λ (the radius of relative stiffness). The computer utilizes the Westergaard equation directly and includes influence from all wheels within a radius of 3 times λ .

2. Maximizing Process

It has been common practice when using the manual count method to align the landing gear footprint on the major axis of the influence chart with one wheel centered over the origin. While this practice does not necessarily produce the maximum possible moment, the values obtained have been considered practical since the procedure eliminates arduous repetitive manual summations of moment blocks.

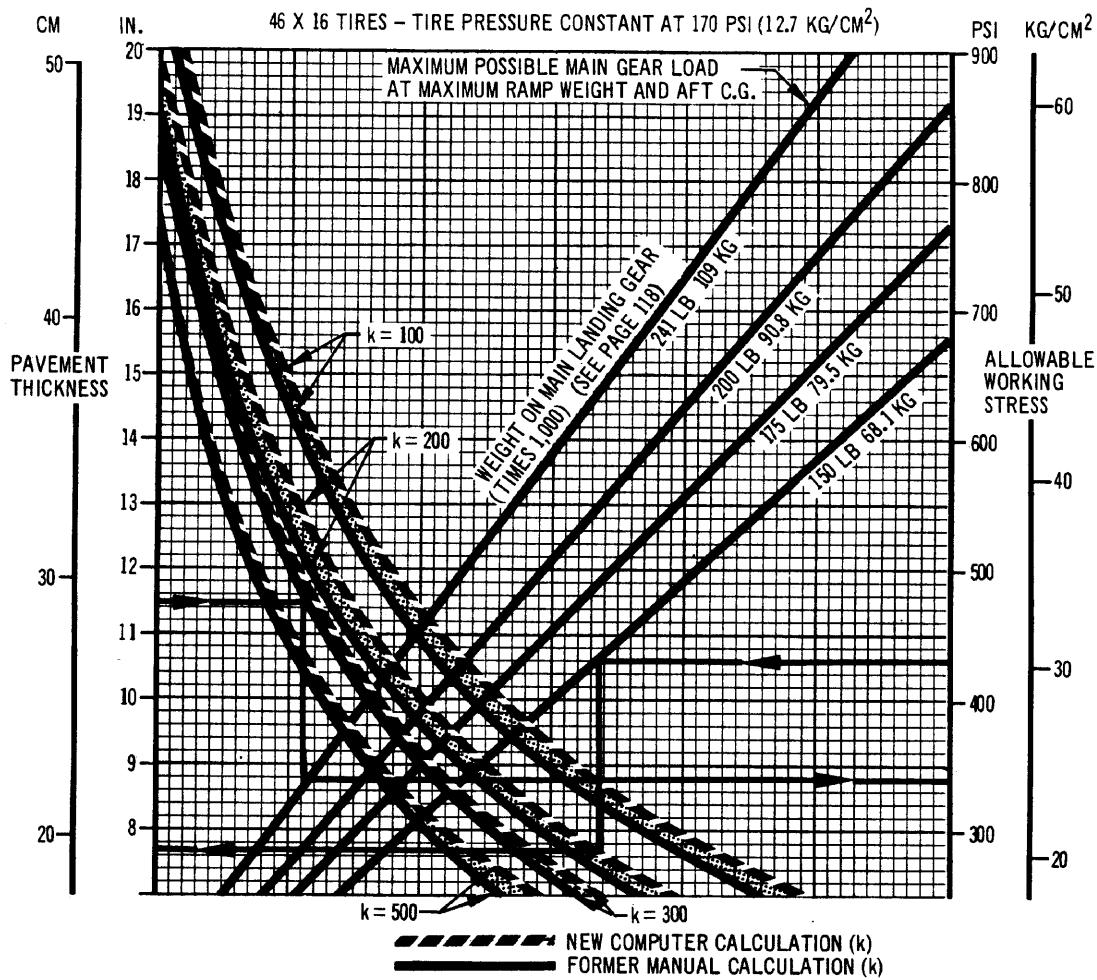

The computer determines the actual maximum stress values by a combination of shifting the footprint in relationship to the origin and by angular rotation of the footprint.

3. Difference in Footprint Shape

An elliptical contact area is used in the computerized version to represent

a single-wheel footprint instead of a rectangle with rounded ends. The variance in moment attributed to this change is minor.

Actual pavement stress for any given model of airplane has not increased. The state of the art in calculation of pavement stress has advanced to permit prediction of stress values to a higher degree of certainty. This permits a proportionate decrease in design stress safety factor.

7.8 RIGID PAVEMENT REQUIREMENTS — LCN CONVERSION

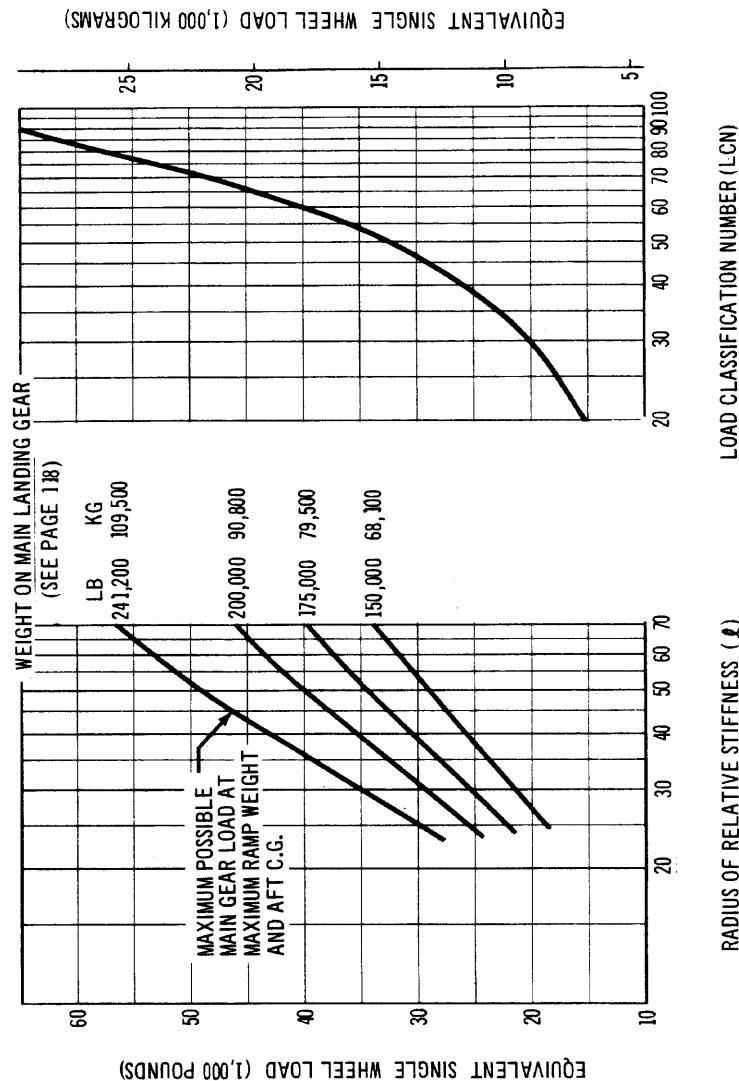

In order to determine the aircraft weight that can be accommodated on a particular rigid pavement, both the LCN of the pavement and the radius of relative stiffness (ℓ) of the pavement must be known.

In the example for the 707-320B shown on page 132, the rigid pavement radius of relative stiffness (ℓ) is shown at 30 with an LCN of 58. For these conditions, the apparent maximum allowable weight permissible on the main landing gear is 250,000 pounds.

NOTE: Provided that the resultant aircraft LCN is not more than 10 percent above the published pavement LCN, the United Kingdom considers the bearing strength of the pavement to be sufficient for unlimited use by the aircraft. The figure of 10 percent has been chosen as representing the lowest degree of variation in LCN that is significant. (Reference: ICAO Aerodrome Manual, Part 2, Aerodrome Physical Characteristics, Chapter 4, Paragraph 4.1.5.7v.)

7.9 FAA METHOD

The charts on pages 138 and 139 are developed directly from pages in FAA Advisory Circular AC 150/5320-6A, dated May 9, 1967.

Pavement thicknesses are shown for gross aircraft weight, irrespective of landing gear configuration and tire pressure. The following general assumptions were made by the FAA in preparing the charts:

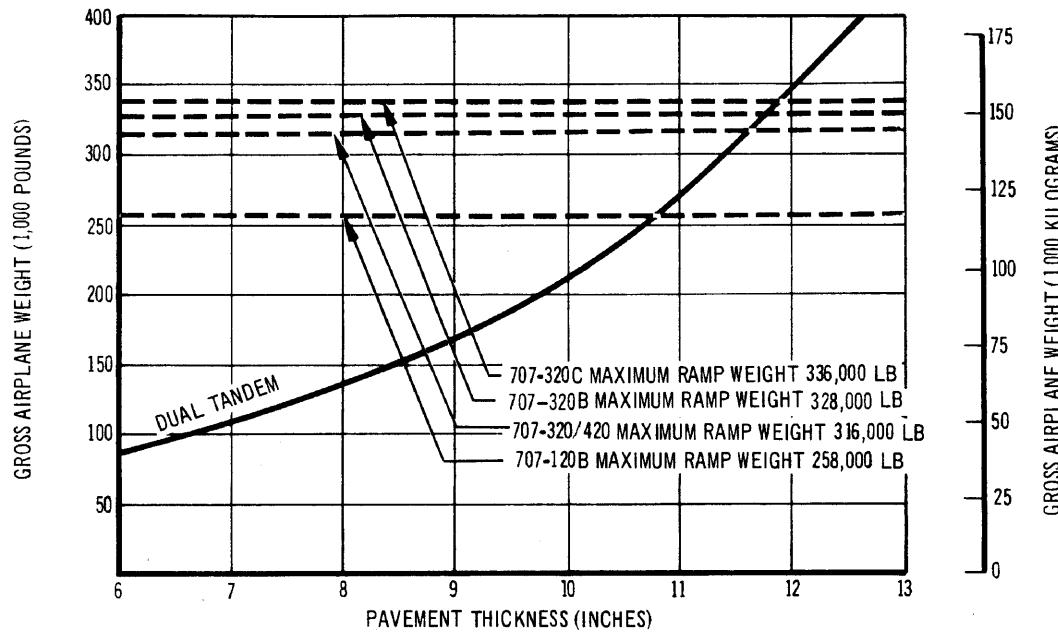

1. Ninety five percent of the gross aircraft weight is assumed to be supported by the main gear.
2. Dual-tandem wheel spacings are not given specifically, but certain design compromises are made as described in the Advisory Circular Appendix 1 in order to develop the curves shown.

The subgrade ratings for pavements are shown as standard FAA designations. These ratings and their derivation are fully described in the Advisory Circular mentioned above.

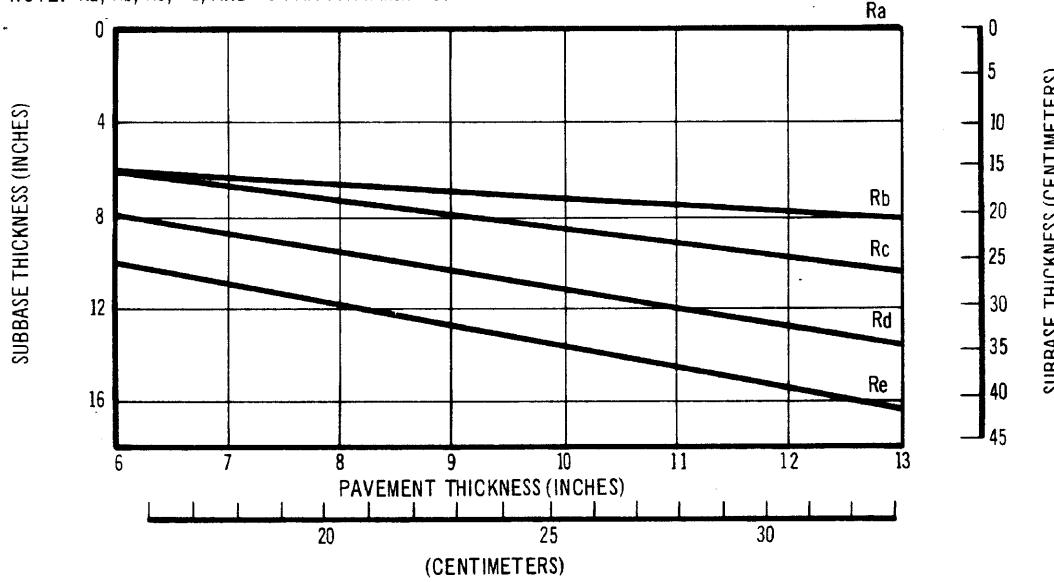

- NOTE:
- PAVEMENT SUBGRADE RATINGS (F_a, F₁, F₂, ETC.) ARE REPRESENTED BY THE DIAGONAL LINES IN THE CHART. INTERSECTION OF A LINE DENOTING SUBGRADE WITH WEIGHT DETERMINES PAVEMENT THICKNESS.
 - CHART ADAPTED FROM PAGE 31 (AND 32), PAR. 17 CHAP. 3 OF FAA ADVISORY CIRCULAR AC 150/5320-6A, DATED 9 MAY 1967.

7.10 ACN/PCN Reporting System - Flexible and Rigid Pavements

To determine the ACN of an aircraft on flexible or rigid pavement, both the aircraft gross weight and the subgrade strength category must be known. In the chart in 7.10.1, for an aircraft with gross weight of 260,000 lb on a (Code B), the flexible pavement ACN is 32. Referring to 7.10.2, the same aircraft on a medium strength subgrade rigid pavement has an ACN of 33.5.

The following table provides ACN data in tabular format similar to the one used by ICAO in the “Aerodrome Design Manual Part 3, Pavements.” If the ACN for an intermediate weight between maximum taxi weight and minimum weight of the aircraft is required, Figures 7.10.1 through 7.10.2 should be consulted.

				ACN FOR RIGID PAVEMENT SUBGRADES – MN/m ³				ACN FOR FLEXIBLE PAVEMENT SUBGRADES – CBR			
AIRCRAFT TYPE	MAXIMUM TAXI WEIGHT MINIMUM WEIGHT (1) LB (KG)	LOAD ON ONE MAIN GEAR LEG (%)	TIRE PRESSURE PSI (MPa)	HIGH 150	MEDIUM 80	LOW 40	ULTRA LOW 20	HIGH 15	MEDIUM 10	LOW 6	ULTRA LOW 3
707-320C	336,000(152,400) 155,100(70,400)	28.50	180 (1.24)	41 16	46 16	55 18	71 24	41 15	48 17	57 20	66 23

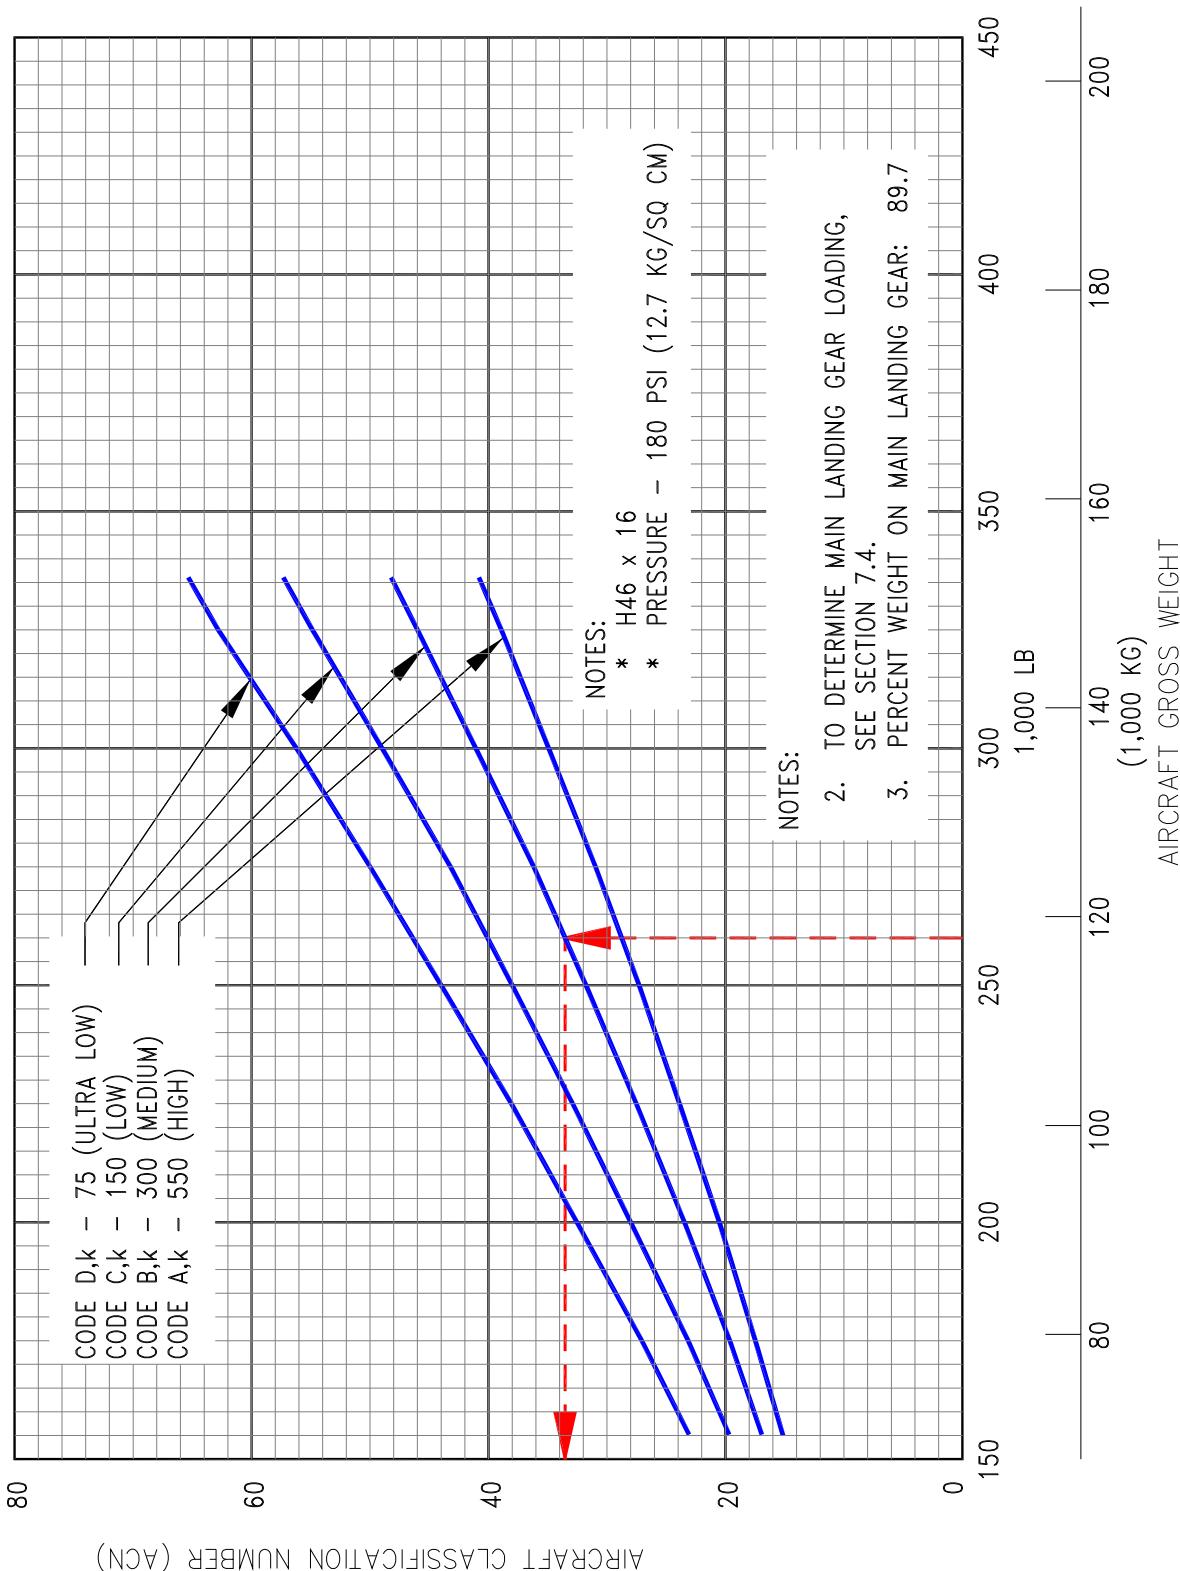

- (1) Minimum weight used solely as a baseline for ACN curve generation.
